900MHz Cordless Answering System

Black Version

(for U.S.A.)

SPECIFICATIONS

	Base Unit	Handset
Power Source:	AC Adaptor (PQLV1Z)	Rechargeable Ni-Cd battery
Receiving Frequency:	24 channels within 906.00~923.25 MHz	24 channels within 906.00~923.25 MHz
Receiving Method:	Double super heterodyne	Double super heterodyne
Transmitting Frequency:	24 channels within 906.00~923.25 MHz	24 channels within 906.00~923.25 MHz
Oscillation Method:	PLL synthesizer	PLL synthesizer
Tolerance of OSC Frequency:	24 MHz \pm 72 Hz	24 MHz \pm 72 Hz
Modulation Method:	NA (FSK/SS)	NA (FSK/SS)
Spread spectrum Method:	Direct sequence	Direct sequence
Chip rate	15 chip	15 chip
ID Code:	22-bit	22-bit
Dial Mode:	Tone (DTMF)/Pulse	Tone (DTMF)/Pulse
Redial:	Up to 32digits	Up to 32 digits
Speed Dialer:		Up to 48 digits
Power Consumption:		7 days at Standby, 4 hours at Talk
Dimension (H \times W \times D):	2 ²⁹ / ₃₂ " \times 6 ⁷ / ₃₂ " \times 8 ⁷ / ₃₂ " (74 \times 175 \times 209mm)	8 ³¹ / ₃₂ " \times 2 ¹ / ₄ " \times 1 ¹³ / ₃₂ " (228 \times 57 \times 36 mm)
Weight	1.01 lbs. (460 g)	0.46 lbs. (210g) with battery

Design and specifications are subject to change without notice.

⚠ WARNING

This service information is designed for experienced repair technicians only and is not designed for use by the general public. It does not contain warnings or cautions to advise non-technical individuals of potential dangers in attempting to service a product. Products powered by electricity should be serviced or repaired only by experienced professional technicians. Any attempt to service or repair the product or products dealt with in this service information by anyone else could result in serious injury or death.

When you mention the serial number, write down all 11 digits. The serial number may be found on the label affixed to the bottom of the unit.

FOR SERVICE TECHNICIANS

ICs and LSIs are vulnerable to static electricity.

When replacing, the following precautions will help prevent recurring malfunctions.

1. Cover the plastic parts boxes with aluminum foil.
2. Ground the soldering irons.
3. Use a conductive mat on the work table.
4. Do not grasp IC or LSI pins with bare fingers.

1 STANDARD BATTERY LIFE

After your Panasonic battery is fully charged;

While in use (TALK)	near the base unit*	Up to about 6 hours
	away from the base unit	Up to about 4 hours
While not in use (Stand-By)		Up to about 14 days

* Within about 10 feet (3 m)

- Battery life may be shortened depending on usage conditions, such as viewing the Caller ID Caller List, and ambient temperature.
- **Clean the handset and the base unit charge contacts with a soft, dry cloth. Clean if the unit is subject to grease, dust or high humidity.** Otherwise the battery may not charge properly.
- If the battery is fully charged, you do not have to place the handset on the base unit until "Recharge battery" is displayed and/or "{ ■}" flashes. This will maximize the battery life.
- The battery cannot be overcharged.

Standby mode

Handset (While off the base unit)

The handset goes into the standby mode after you finish using the handset (marking/answering a call, viewing the Caller List or directory list etc.). The display is blank, but the handset can receive calls. The battery life is conserved in this mode.

Base Unit

The base unit goes into the standby mode after you finish using the base unit (marking/answering a call, using the intercom, using the answering system etc.). Programming and storing phone numbers are possible **only when** the base unit is in the standby mode.

Battery strength

You can check the battery strength on the display while the handset is on the base unit, while it is in use (making/answering a call etc.), or after viewing the Caller List, or directory items, programming, etc. The battery strength will remain for 5 seconds after using the handset, then the display will return to the stand-by mode.

The battery strength is as shown in the chart below.

Display prompt	Battery strength
{■■■■}	Fully charged
{■■■}	Medium
{■■}	Low
⚡{■■}⚡ (flashing)	Needs to be recharged.

Recharge

- Recharge the battery when:
- "Recharge battery" is displayed on the handset,
 - "{■■}" flashes on the handset display, or
 - The handset beeps intermittently while it is in use.

2 LOCATION OF CONTROLS

3 DISPLAYS

Both the handset and the base unit show you instructions and information on the displays. These display prompts are shown below.

3.1. Common prompts for the handset and the base unit

No items stored

The Caller List is empty or there are no stored items in the directory.

TINA ROBINSON
1-000-222-3333

When a call is received, the display shows the caller's name and number after the first ring.

JACK SMITH
1-222-333-4444
11:20A JAN.12 x3

This is a name from the Caller List.

The display shows:

- the caller's name,
- the caller's number,
- the time and date of the last call (ex. Jan. 12, 11:20 AM), and
- the number of times called (ex. 3 times).

Ann 
1234567890

This is a name from the directory. The stored name and phone number are displayed.

NANCY BROWN
1-000-222-3333
----Waiting-----

A second call is received during a conversation.

3.2. Handset only

Recharge battery
⏻ [] ⏻

The battery needs to be charged. Place the handset on the base unit to charge the battery.

12 new calls
[] [] [] []

The display shows the number of new calls and the battery strength while the handset is on the base unit.

12 new calls
▲ ▶=Directory

The display shows the number of new calls when ▼ or ▲ is pressed while the handset is off the base unit.

To search from the most recent call, press ▼.

To search from the oldest call, press ▲.

To go to the directory list, press **FWD/EDIT** ▶ (Directory key).

Talk
01-06-35 [] [] [] []

During a conversation, the display shows the length of the call (ex. 1 hour, 6 minutes and 35 seconds). The battery strength is also displayed.

No link to base.
Place on cradle
and try again.

The handset has lost communication with the base unit. Place the handset on the base unit and try again.

Please lift up
and try again

▼, ▲, **BACK** ◀ or **FWD/EDIT** ▶ was pressed while the handset was on the base unit. Lift the handset and press the button again.

⏻ Ringer off ⏻

When the ringer volume is set to OFF, "Ringer off" will flash for about 45 seconds before the unit returns to the standby mode.

📖
Directory full

When trying to store an item or Caller List information in the directory, the directory memory is full.

Not available

▼, ▲, **BACK** ◀ or **FWD/EDIT** ▶ was pressed while the base unit was not in the standby mode.

Answering
system setting.
See base unit.

The unit is in answering system programming mode.

Remote
operation

The handset is operating the answering system remotely.

Save error

During a programming procedure, the handset has lost communication with the base unit. Move closer to the base unit.

3.3. Base unit only

SUN 12:00AM
5 new calls
10 messages

In the standby mode, the display shows the current day and time, the number of new calls and recorded messages. (Ex. 5 new calls have been received and 10 messages have been recorded.)

SUN 12:00AM
0 message

When the clock needs adjusting, the day and time flash.

5 new calls
<=<Old >>=New

This display will be shown when **CALLER ID** is pressed. To search from the most recent call, press **SKIP/FF** (New key). To search from the oldest call, press **REPEAT/REW** (Old key).

Greeting record
Recording error

Your greeting message was not recorded correctly. Record it again.

Greeting check
00-12

A greeting message is being played. The display shows the elapsed time.

NANCY BROWN
↓-000-222-3333
- Answering -

The answering system is recording a message. (“- Answering -” flashes.)

SUN 12:00AM
5 new calls
Message full

Message memory is full. (“Message full” flashes.) Erase some or all of the messages.

PAGER
SUN 12:00AM
5 new calls
10 messages

The pager call mode is set to ON.

SUN 12:00AM
Ringer off
10 messages

The ringer volume is set to OFF.

Handset in use

This display will be shown when the handset is used (making/answering a call, viewing the Caller List or directory list, etc.).

4 CONNECTION

Note:

- USE ONLY WITH Panasonic AC ADAPTOR PQLV1Z.
- The AC adaptor must remain connected at all times. (It is normal for the adaptor to feel warm during use.)
- If your unit is connected to a PBX which does not support Caller ID and voice mail services, you cannot access those services.

4.1. Adding Another Phone

This unit will not function during a power failure. To connect a standard telephone on the same line, use the Panasonic T-adaptor KX-J66.

5 OPERATION

5.1. Making Calls

5.1.1. With the Handset

To have a hand-free conversation, connect the headset to the handset.

1 Press **TALK** .

Talk

2 Dial a phone number.

- The dialed number is displayed.
- After a few seconds, the display will show the length of the call and the battery strength.

Talk
1112222

Talk
00-00-00 {■■■■}

3 To hang up, press **TALK** or place the handset on the base unit.

If noise interferes with the conversation

Press **FUNCTION/EXIT/CH** to select a clearer channel or move closer to the base unit.

To redial the last number dialed on the handset

Press **TALK** ➡ **REDIAL/PAUSE** .

To dial after confirming the entered number

- 1 Dial a phone number.
 - If you misdial, press **INTERCOM/CLEAR**. All digits are erased. Dial the correct phone number.

- 2 Press **TALK**.
 - After a few seconds, the display will show the length of the call and the battery strength.

Talk

Talk

00-00-00

{■■■■}

- 3 To hang up, press **TALK** or place the handset on the base unit.

To redial after confirming the last number dialed

Press **REDIAL/PAUSE** ➡ **TALK**.

To select the receiver volume

Press **▲** or **▼** while talking.

- Each time you press **▲** or **▼**, the volume level will change.
- The display will return to the length of the call.
- Your phone comes from the factory set to MEDIUM.
- When you replace the battery, the selected receiver volume setting will return to the factory set (MEDIUM). Reprogram if necessary.

Backlit LCD display

The lighted handset display will stay on for about 10 seconds after pressing a handset button or lifting the handset off the base unit.

Lighted handset keypad

The handset dialing buttons will light when you press a button or lift the handset off the base unit, and flash when a call is received. The lights will go out about 10 seconds after pressing a button, lifting the handset or answering a call.

5.1.2. With the Base Unit

- 1 Press **DIGITAL SP-PHONE** .
 - The DIGITAL SP-PHONE indicator lights.

Talk

- 2 Dial a telephone number.

Talk
1112222

- 3 When the other party answers, talk into the **MIC** (microphone).

Talk
00-00-00

- 4 To hang up, press **DIGITAL SP-PHONE** .
 - The indicator light goes out.

- To switch to the handset while using the speakerphone:
 - If the handset is off the base unit, press **TALK** .
 - If on the base unit, just lift up.
- During a call using the handset, the call can be switched to the speakerphone by pressing **DIGITAL SP-PHONE** on the base unit.

Hands-free Digital Speakerphone

For best performance, please note the following:

- Talk alternately with the caller in a quiet room.
- If the other party has difficulty hearing you, press **VOLUME**  to decrease the speaker volume.
- If the other party's voice from the speaker cuts in/out during a conversation, press **VOLUME**  to decrease the speaker volume.

To adjust the speaker volume (8 levels) while talking

To increase, press **VOLUME** .

To decrease, press **VOLUME** .

To redial the last number dialed on the base unit

Press **DIGITAL SP-PHONE** ➔ **REDIAL** .

To put a call on hold

Press **HOLD** .

- The DIGITAL SP-PHONE indicator flashes.

To release the hold

From the base unit, press **DIGITAL SP-PHONE** .

From the handset, press **TALK** or lift the handset off the base unit.

- If another phone is connected on the same line, you can also release the hold by lifting its handset.

5.2. Answering Calls

When a call is received, the unit rings and the CALLER ID button on the base unit flashes quickly. If you subscribe to a Caller ID service, the calling party information will be displayed after the first ring. In order to view the Caller ID information, please wait until the second ring to answer a call.

5.2.1. With the Handset

Lift the handset off the base unit and press

TALK.

You can also answer a call by pressing any dialing button **0** to **9**, ***** or **#** (**Any Key Talk**).

Auto Talk

If you set the Auto Talk feature to ON, you can answer a call by lifting the handset off the base unit without pressing **TALK**.

CALLER ID button

When the headset is connected, make sure to use the headset to talk with the caller. If you want to have a normal cordless phone conversation, disconnect the headset.

5.2.2. With the Base Unit

- 1 Press **DIGITAL SP-PHONE**.
 - The DIGITAL SP-PHONE indicator lights.
- 2 Talk into the **MIC**.
- 3 To hang up, press **DIGITAL SP-PHONE**.
 - The indicator light goes out.

5.3. Automatic Answering Operation

When the unit answers a call, a greeting message is played and the caller's message is recorded. While recording, "- Answering -" will be displayed.

- The total recording time (including greeting message) is **about 15 minutes**. If messages are recorded in noisy rooms, the time may be shortened by up to 3 minutes.
- A maximum of 64 messages (including greeting message) can be recorded.

5.3.1. Setting the Unit to Answer Calls

Press **ANSWER ON** to turn on the answering system.

- The indicator lights and "Answer set" is heard.
- The unit will announce the remaining recording time if it is less than 5 minutes.
- If you hear "Memory full", "Message full" is displayed on the base unit and the ANSWER ON indicator flashes rapidly, erase some, or all, of the messages.

- If you do not want the unit to answer calls, press **ANSWER ON** again to turn off the answering system. The indicator light goes out and "Answer off" is heard.
- You can also turn on the answering system remotely using any other phone.

Monitoring incoming calls

While a call is being recorded, you can monitor it through the speaker. To answer the call with the speakerphone, press **DIGITAL SP-PHONE**. For the handset, lift the handset off the base unit and press **TALK**. The unit stops recording.

5.4. Listening to Messages

You can see the total number of recorded messages on the base unit display. If the ANSWER ON indicator flashes, new messages have been recorded.

Listening to only new messages

Press **NEW MESSAGE** briefly.

- The unit announces the number of new messages and plays them back.

Listening to all recorded messages

Press and hold **NEW MESSAGE** until playback starts.

- During playback, the display shows which message is being played.
(Ex. While the first message is being played back, "Message 1" is displayed.)
- At the end of the last message, "End of final message" is heard. The unit will announce the remaining recording time if it is less than 5 minutes.

5.4.1. During playback

To repeat/ rewind message	<p>To repeat from the beginning of the message Press [REPEAT/REW] briefly.</p> <ul style="list-style-type: none"> • If you press within 5 seconds of playback, the previous message will be played. <p>To rewind part of the message Press and hold [REPEAT/REW] until you reach the desired place.</p> <ul style="list-style-type: none"> • At the beginning of the message, 3 beeps will sound.
To skip/cue message	<p>To skip to the next message Press [SKIP/FF] briefly.</p> <p>To cue to part of the message Press and hold [SKIP/FF] until you reach the desired place.</p> <ul style="list-style-type: none"> • The message will be heard at twice the normal speed. • At the end of the message, 3 beeps will sound.
To stop operation	<p>Press [STOP/EXIT] .</p> <ul style="list-style-type: none"> • To resume playback, press [NEW MESSAGE]. • If you do not press any button for 60 seconds or if you press [STOP/EXIT] again, the unit will return to the standby mode.

For Caller ID service users

- During playback, the base unit display will show the name and/or number of the caller whose message is being played.

To call back the displayed number:

During playback, lift the handset and press **[TALK]** within 10 seconds, or press **[DIGITAL SP-PHONE]** .

—The unit stops playback and automatically dials the displayed phone number.

- After listening to new incoming messages, “✓” will be added to the call entries in the Caller ID Caller List.

Remove the P. C. Board

SP LEAD THROUGH RIGHT SIDE
RIB. DON'T DRESS UPSIDE.

Fig. 4

Fig. 5

Fig. 6

Shown in Fig.-	To Remove	Remove
1	Lower Cabinet	Screws (2.6 X 12).....(A) X 5
2	Main P.C. Board	Remove the P.C. Board
3	Lower Cabinet	Screw (3 X 12).....(B) X 1
		Screws (3 X 8).....(C) X 3
4	Battery Cover	Remove the Battery Cover
5	Rear Cabinet	Screws (2.6 X 12).....(D) X 2
6	Main P.C. Board	Screw (2.6 X 12).....(E) X 1
		Screws (2.6 X 8).....(F) X 2
		Remove the lead
		Remove the P.C. Board

Note

*1 — After removing 2 screws (D), insert a (-) driver into *1 and pull it outside of the cabinet.

7 ASSEMBLY INSTRUCTIONS

7.1. Assembly the LCD to P.C. Board (Base Unit)

1. Open the lid of the connector to this side.

2. Insert the LCD cable through the hole of P.C. Board and hook the top of LCD cable back of P.C. Board.
(See Fig. 7.)

3. Close the lid of connector.

4. Hangs on the substrate with right and left catch.

Fig. 7

7.2. Assembly the LCD to P.C. Board (Handset)

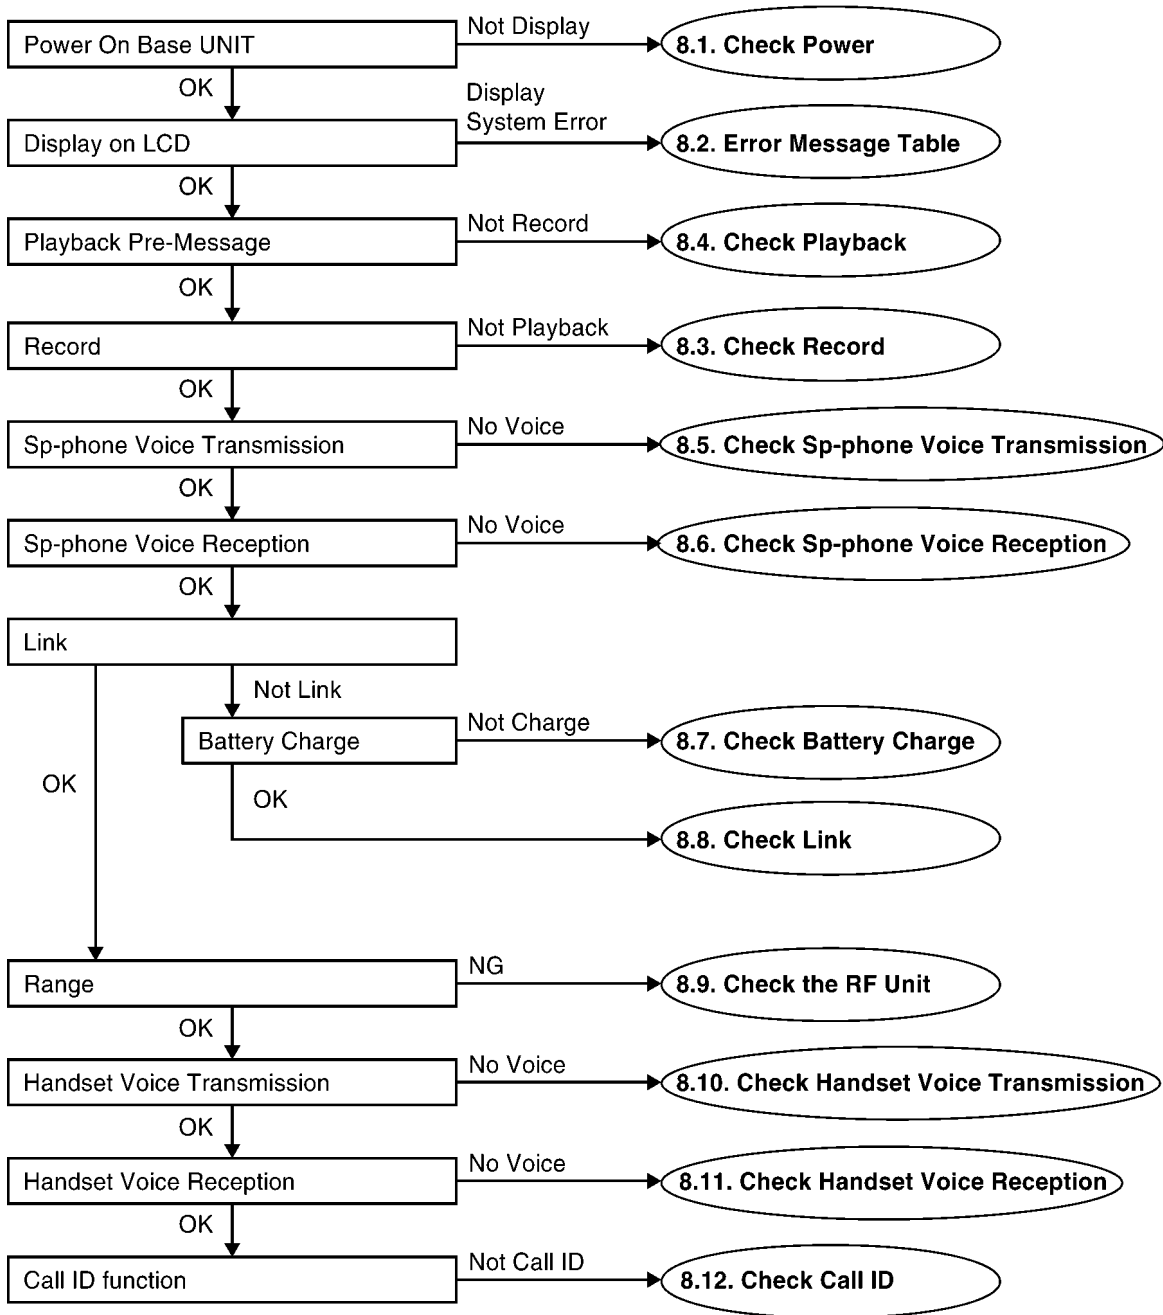

7.3. Adjustment to prevent the cabinet from opening at dropping

Stick the rubber on the front cabinet as shown in the figure to prevent the cabinet from opening at dropping.

8 TROUBLESHOOTING GUIDE

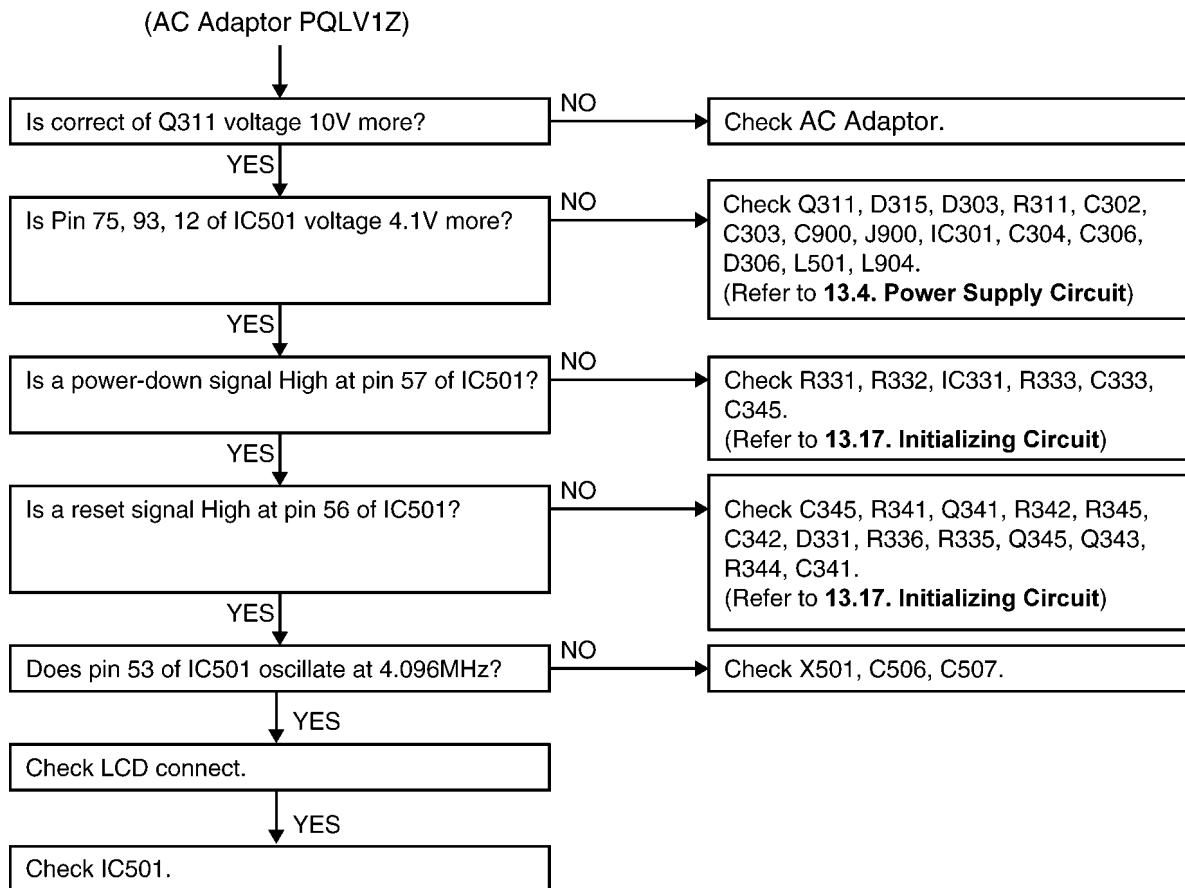

MAIN

8.1. Check Power

BASE UNIT

Is the AC Adaptor inserted into 120V outlet?

8.2. Error Message Table

Display	Symptom	Remedy
System error 1	The initialization was tried, but it could not be done.	1. Confirm Flash Memory is equipped. 2. Confirm the connection of Flash Memory. 3. Confirm the power supply of Flash Memory. When no error is found in above-mentioned items, Flash Memory has a defect. Replace Flash Memory.
System error 2	The defect of Flash Memory was detected.	When Flash Memory has the fatal detect, replace Flash Memory. This error hardly occurs.
System error 3 System error 9	When the adjustment data was checked, an error was detected. (The adjustment data may not be written.)	1. Confirm Flash Memory is equipped. 2. Confirm the connection of Flash Memory. 3. Confirm the power supply of Flash Memory. When no error is found in above-mentioned items, Flash Memory has a defect. Replace Flash Memory.
System error 4	The defect of DSP was detected. (The chip in DSP may have a defect.)	1. Confirm the connection of DSP. 2. Confirm the oscillation frequency of DSP. When no error is found in above-mentioned items, DSP has a defect. Replace DSP.
System error 5 System error 6	The defect of DSP was detected.	When DSP has the fatal defect, replace DSP. This error hardly occurs.
System error 7	The defect of synthesized voice was detected. (The synthesized voice may not be written.)	1. Confirm Flash Memory is equipped. 2. Confirm the connection of Flash Memory. 3. Confirm the power supply of Flash Memory. When no error is found in above-mentioned items, Flash Memory has a defect. Replace Flash Memory.

NOTE:

Flash memory is IC751. DSP is IC501

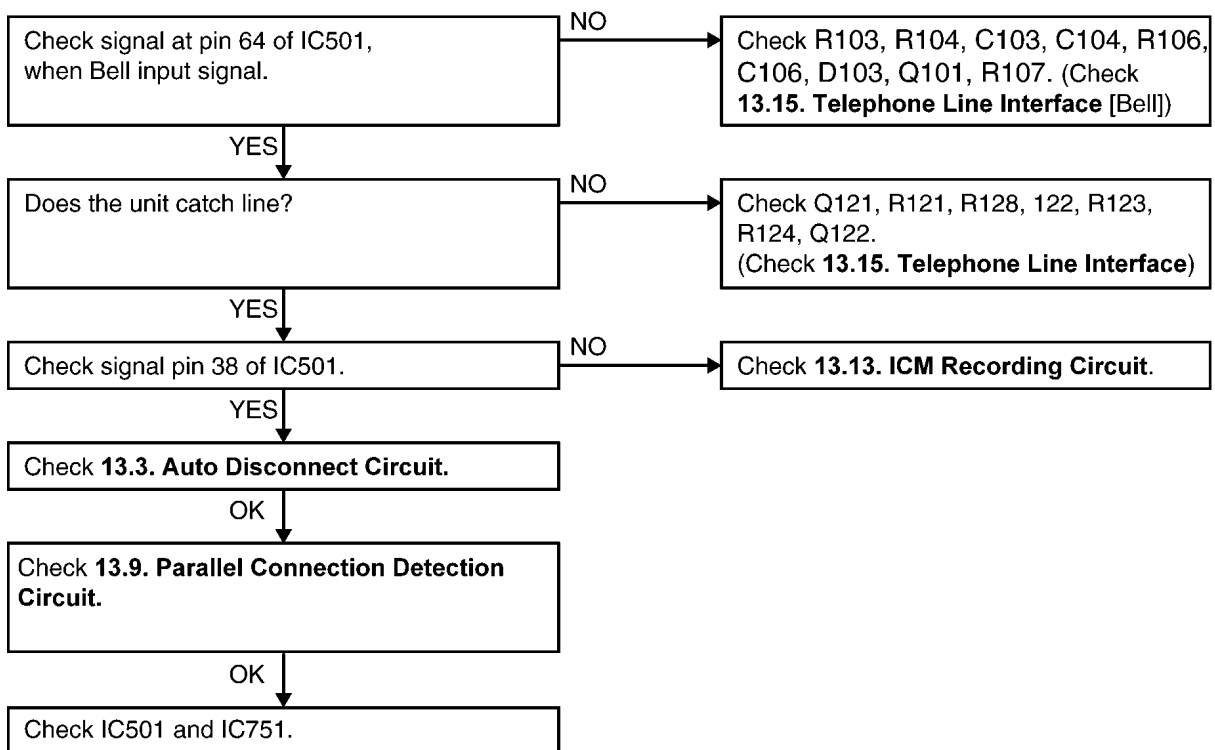

8.3. Check Record

BASE UNIT

Not record Greeting Message

Not record Incoming Message

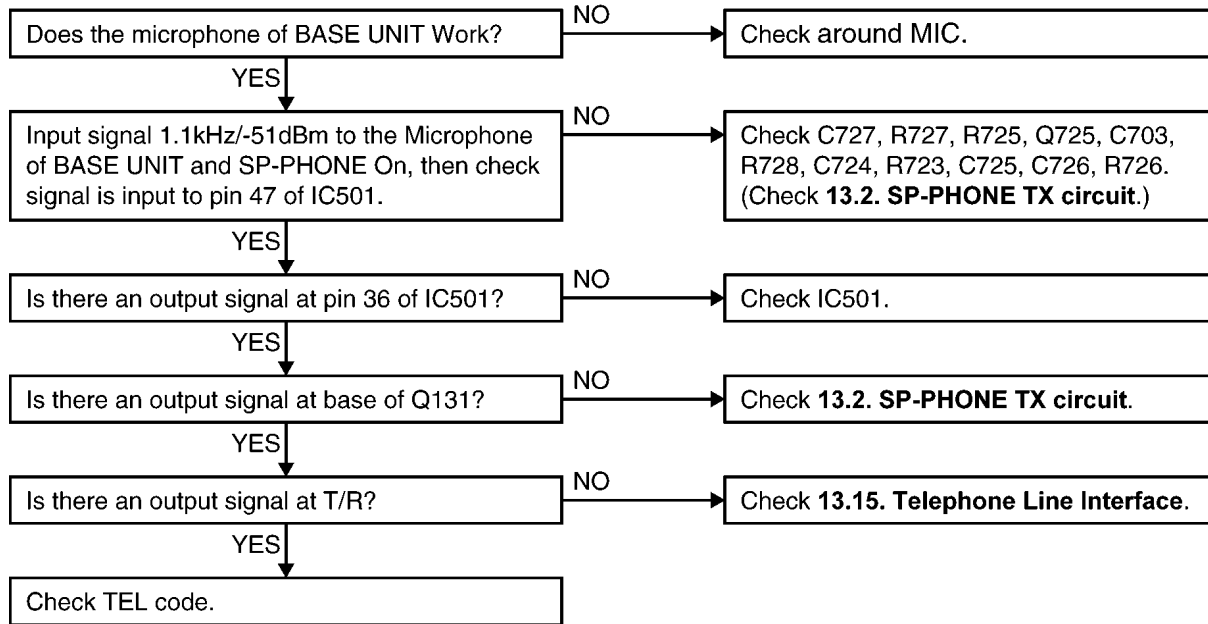

8.4. Check Playback

BASE UNIT

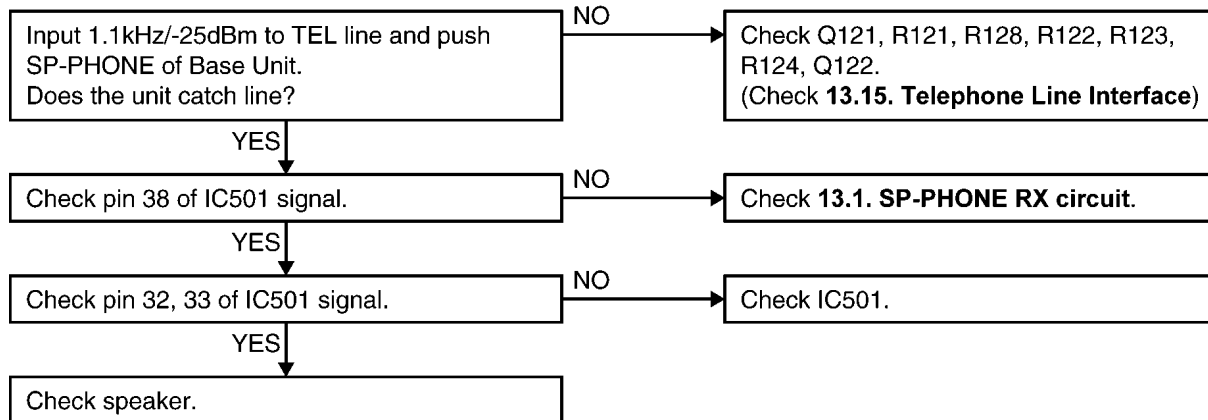

8.5. Check Sp-phone Voice Transmission

BASE UNIT

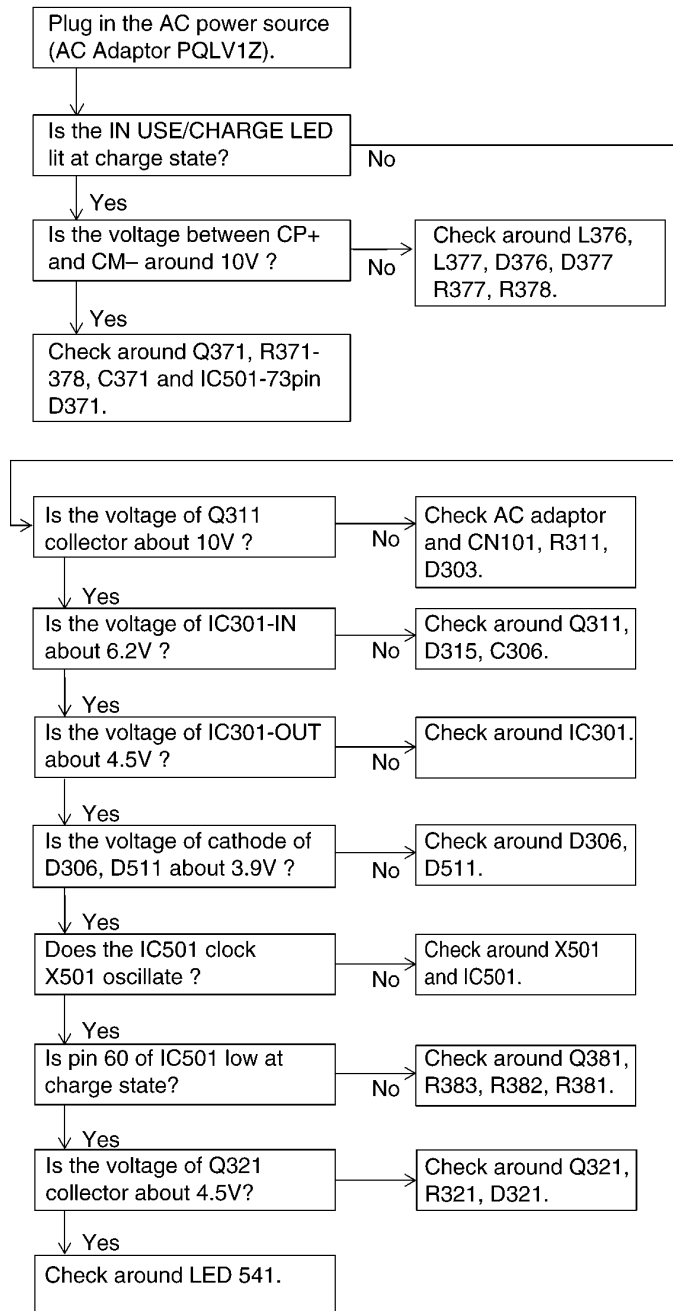

8.6. Check Sp-phone Voice Reception

BASE UNIT

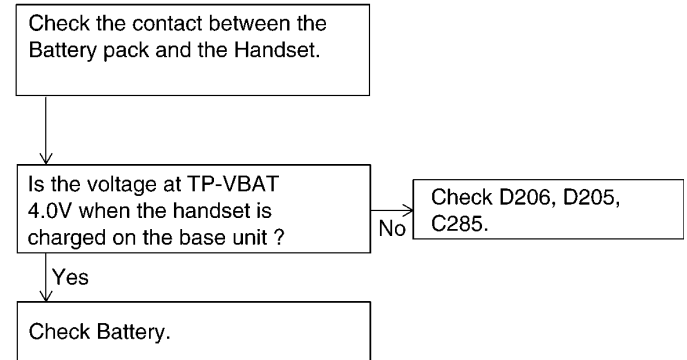

8.7. Check Battery Charge

BASE UNIT

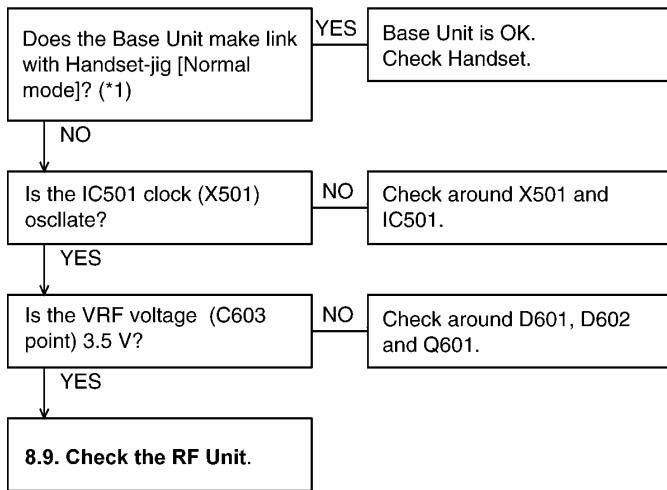

HANDSET

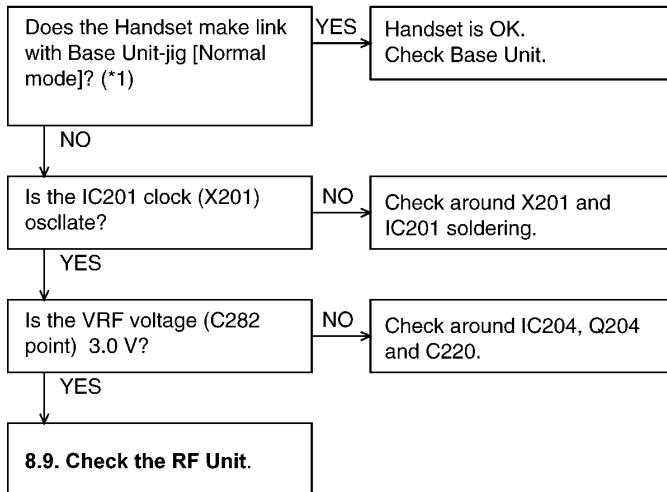

8.8. Check Link

BASE UNIT

HANDSET

(*1) Refer to "8.9.1. Finding out the Defective Unit."

8.9. Check the RF Unit

8.9.1. Finding out the Defective Unit

Prepare HS JIG (Handset-jig) and BS JIG (Base Unit-jig). Place the HS JIG on the cradle of the base unit for checking, then confirm that they are linked. Place the handset for checking on the cradle of the BS JIG, then confirm that they are linked. How to confirm the link is as follows; press the TALK button and confirm that the LEDs of the base unit is turned ON.

8.9.2. Check Items

8.9.2.1. Handset-jig (HS JIG) for Base Unit

The handset unit jig also uses two modes: TEST SUPER LOW mode and NORMAL POWER mode. These modes alternate when the handset CLEAR button is pressed:

(1) NORMAL POWER mode (Stand-By). In this mode the LCD will remain blank.

(2) TEST SUPER LOW mode. When the CLEAR button is pressed, the LCD will show TEST SUPER LOW. This test simulates the handset is at very large distance from the base unit and the TX signal from handset to base is very small.

Procedure: First place handset jig on base under test to charge (exchange security code); press CLEAR and then TALK to operate. The LCD will show TALK and TEST. This means that the base unit sensitivity is OK.

* In TALK mode, LCD display change to "TALK TEST" or "TALK" on [TEST POWER] mode or [NORMAL POWER] mode.

* HS JIG becomes [NORMAL POWER] mode immediately after the power supply turning on.

NOTES:

1) If when setting the handset to TEST SUPER LOW mode, if handset beeps 3 times and the LCD shows "No link to base. Place on cradle and try again", press 2, 5, 8, 0 simultaneously and then disconnect battery. Re-install battery, place unit on cradle to get security codes and tries again.

2) Only KX-TC1851B with marks HS JIG can be used for troubleshooting. Regular KX-TC1851B production samples does not have the software needed for troubleshooting.

3) You can differentiate the jig from a regular unit because the jig has silver bottom cabinet (base) and back cabinet (handset).

8.9.2.2. Base Unit - jig (BS JIG) for Handset

The base unit jig uses two modes: NORMAL POWER mode and TEST POWER mode. These modes alternate when the base unit LOCATOR button is pressed:

(1) NORMAL POWER mode, TEST SUPER LOW (red) is OFF. This test simulates the handset is at normal/close distance. The base unit is in NORMAL POWER mode right after the AC adapter has been inserted.

(2) TEST SUPER LOW (POWER) mode, TEST SUPER LOW LED (red) is ON. This test simulates the handset is at very large distance from the base unit and the TX signal from base to handset is very small.

Procedure: First, place handset under test to charge (exchange security code), then remove handset from base after you hear a beep; press LOCATOR on base unit (red LED lights). Press TALK button on handset and if it links with the base, then this handset sensitivity is OK.

* BS JIG becomes [NORMAL POWER] mode immediately after the power supply turning on.

NOTES:

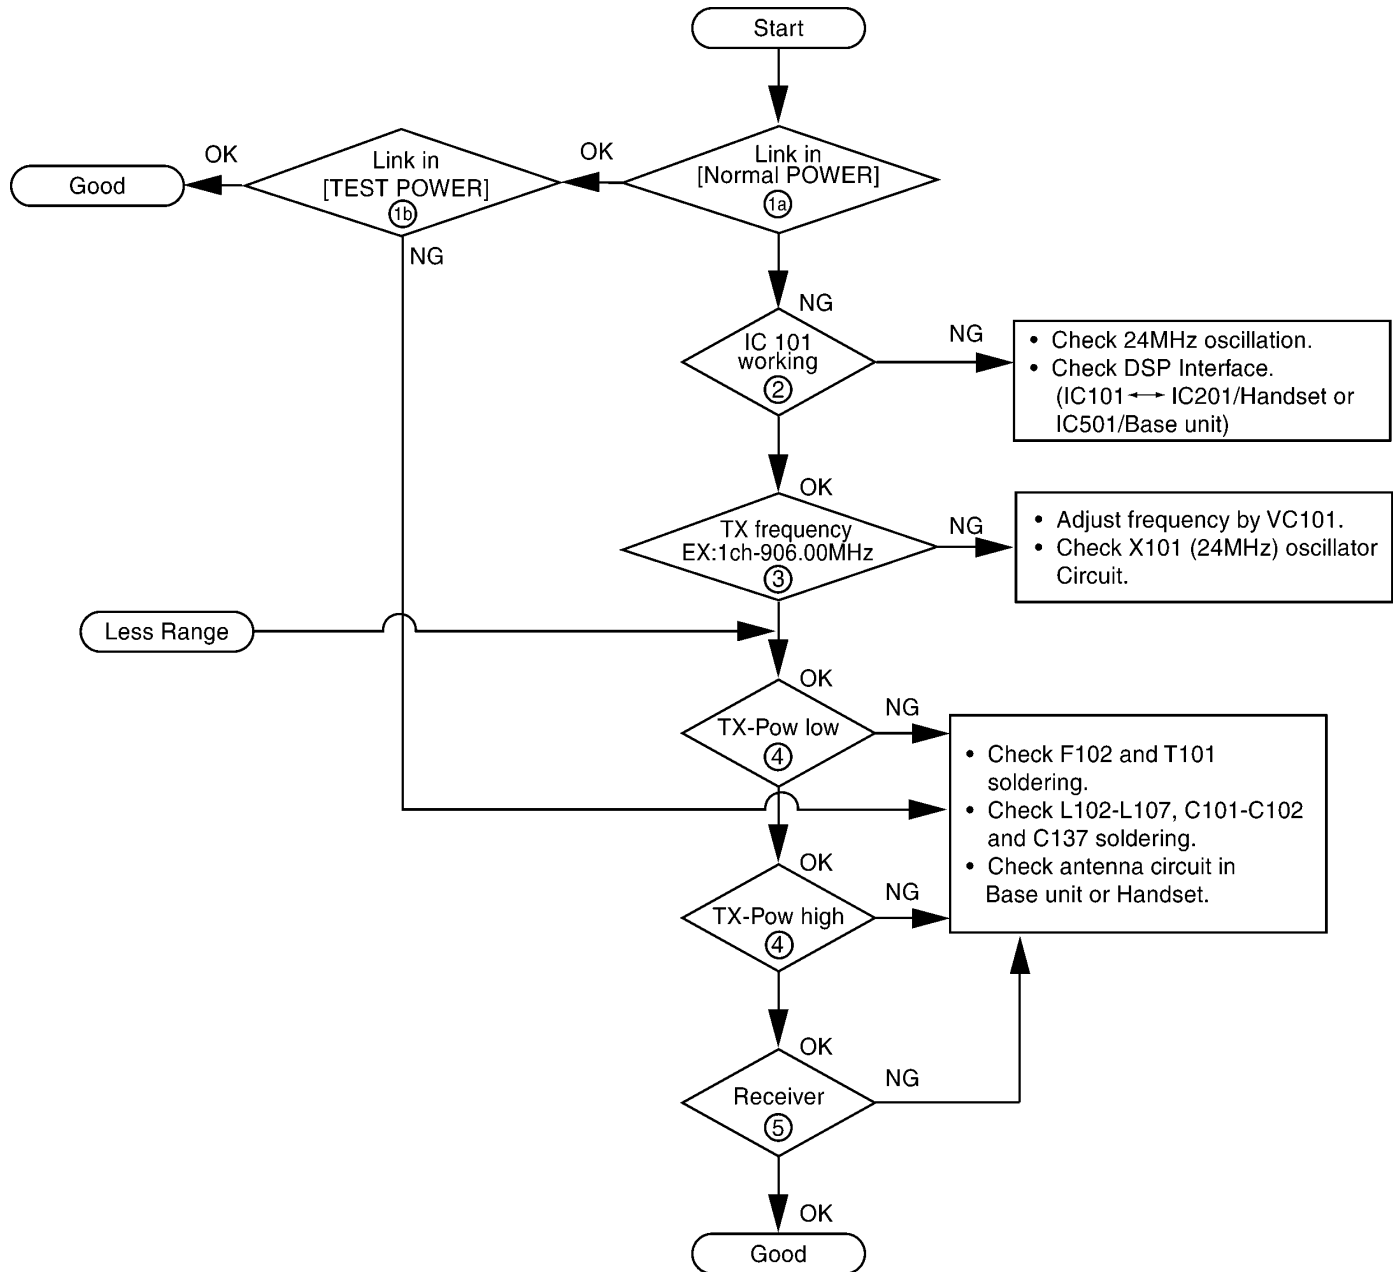

1) If when setting the base to TEST SUPER LOW mode, if handset beeps 3 times and the LCD shows "No link to base. Place on cradle and try again", press 2, 5, 8, 0 simultaneously and then disconnect battery. Re-install battery, place unit on cradle to get security codes and tries again.

2) Only KX-TC1851B with marks BS JIG can be used for troubleshooting. Regular KX-TC1851B production samples does not have the software needed for troubleshooting.

3) You can differentiate the jig from a regular unit because the jig has silver bottom cabinet (base) and back cabinet (handset).

8.9.3. RF Check Flowchart

(*) Details of confirmation items are following in "8.9.4. Check Table for RF Block".

8.9.4. Check Table for RF Block

No	Item		BS(Base unit) (*1)	HS(Handset) (*1)
1a.	Link confirmation [NORMAL POWER]	Procedure	1. Put "HS JIG" on BS. 2. Set MODE to [NORMAL POWER] position of "HS JIG". 3. Press [TALK] key of "HS JIG" to establish link .	1. Put HS on "BS JIG". 2. Set MODE to [NORMAL POWER] position of "BS JIG". 3. Press [TALK] key of "HS" to establish link.
1b.	Link confirmation [TEST POWER]	Procedure	1. Change MODE to [TEST POWER] position of "HS JIG". 2. Press [TALK] key of "HS JIG" to establish link about 30cm away from "BS".	1. Change MODE to [TEST POWER] position of "BS JIG". 2. Press [TALK] key of "HS" to establish link about 30cm away from "BS JIG".
2	IC101 working confirmation	Procedure	1. Set Test-mode [Continuos Send Low Power].(*3) 2. Confirm X101 oscillate(24MHz). (*4)	1. Set Test-mode [Continuos Send Low Power].(*3) 2. Confirm X101 oscillate(24MHz) (*4).
		Check point	1. Check X101 oscillator. 2. Check DSP interface(IC101←→IC501/BS) (*5).	1. Check X101 oscillator. 2. Check DSP interface(IC101←→IC201/HS) (*5).
3	TX frequency Adjustment	Procedure	1. Set Test-model [Continuos Send Low Power].(*3) 2. Confirm TX-carrier frequency (1CH = 906MHz).	1. Set Test-mode [Continuos Send Low Power].(*3) 2. Confirm TX-carrier frequency (1CH = 906MHz).
		Check point	1. Adjust frequency by VC101.(*3) 2. Check X101 oscillator Circuit.	1. Adjust frequency by VC101.(*3) 2. Check X101 oscillator Circuit.
4	TX Power confirmation	Procedure	1. Put RF wire to ANT and ANT_GND(See 9.4. Base Unit Reference Drawing). Connect this wire Marconi or Spectrum Analyzer. 2. Set Test-mode [Continuos Send Low Power].(*3) 3. Confirm TX power level within -3~±5dBm (*2) (0.158~1.58mW) 4. Set Test-mode [Continuos Send High Power].(*3) 5. Confirm TX power level within +17±4dBm (20~126mW)	1. Put RF wire to ANT and ANT_GND(See 9.5. Handset Reference Drawing). 2. Set Test-mode [Continuos Send Low Power].(*3) 3. Confirm TX power level within -4±5dBm (*2) (0.126~1.26mW) 4. Set Test-mode [Continuos Send High Power].(*3) 5. Confirm TX power level within +16±4dBm (16~100mW)
		Check point	1. Check F102 and T101 soldering. 2. Check L102~107, C101~102 and C137 soldering. 3. Check Antenna in BS.	1. Check F102 and T101 soldering. 2. Check L102~107, C101~102 and C137 soldering. 3. Check Antenna in HS.
5	Receiver confirmation	Procedure	1. Put "HS JIG" on BS. 2. Set MODE to [NORMAL POWER] position of "HS JIG". 3. Press [TALK] key of "HS JIG" to establish link . 4. Change MODE to [TEST POWER] position of "HS JIG". 5. Press [TALK] key of "HS JIG" to establish link about 30cm away from "BS".	1. Put HS on "BS JIG". 2. Set MODE to [NORMAL POWER] position of "BS JIG". 3. Press [TALK] key of "HS" to establish link. 4. Change MODE to [TEST POWER] position of "BS JIG". 5. Press [TALK] key of "HS" to establish link about 30cm away from "BS JIG".
		Check point	1. Check F102 and T101 soldering. 2. Check L102~107, C101~102 and C137 soldering. 3. Check Antenna in BS.	1. Check F102 and T101 soldering. 2. Check L102~107, C101~102 and C137 soldering. 3. Check Antenna in HS.

8.10. Check Handset Voice Transmission

HANDSET

BASE UNIT

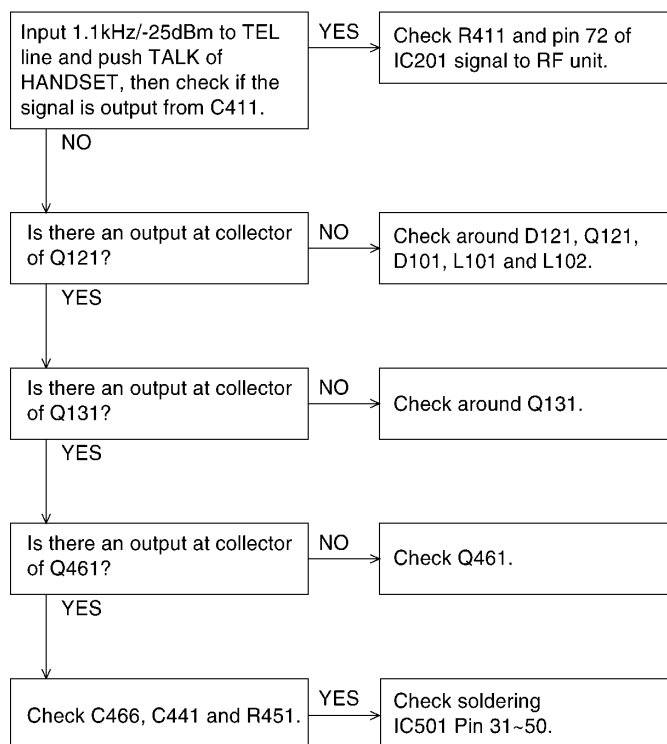

Note:

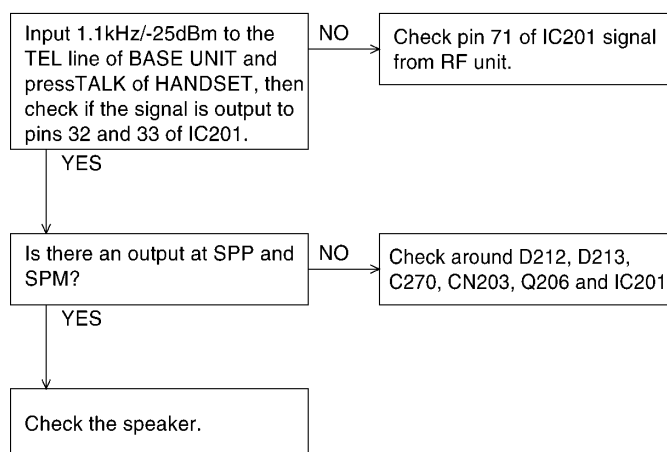

If you change MIC.
Put some bond or hot melt at hole of MIC behind after changing MIC.

8.11. Check Handset Voice Reception

BASE UNIT

HANDSET

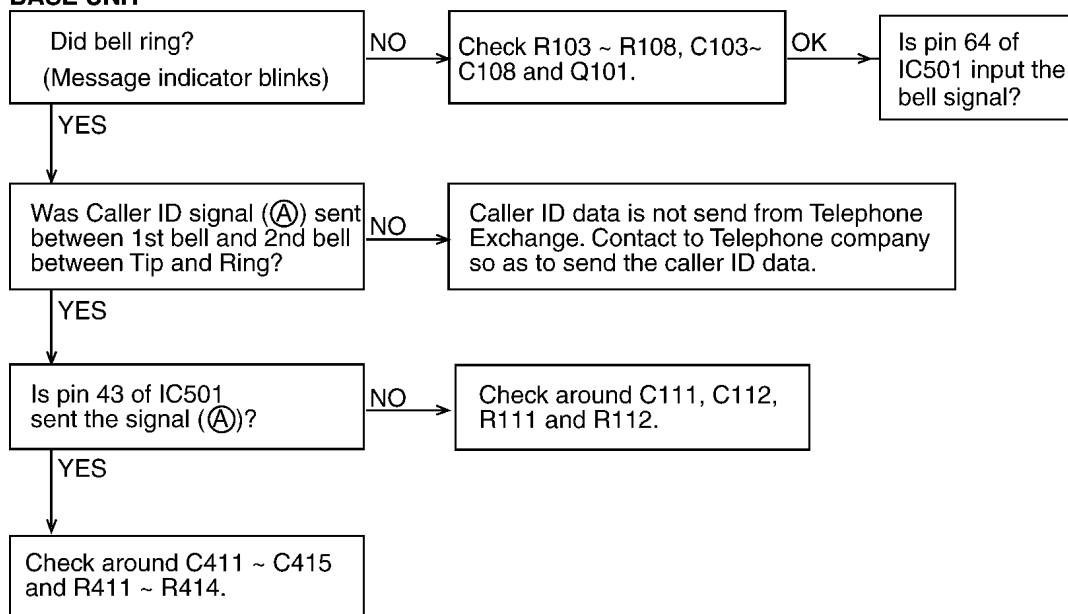

NOTE:

When checking the RF UNIT, Refet to **8.9. Check the RF Unit**

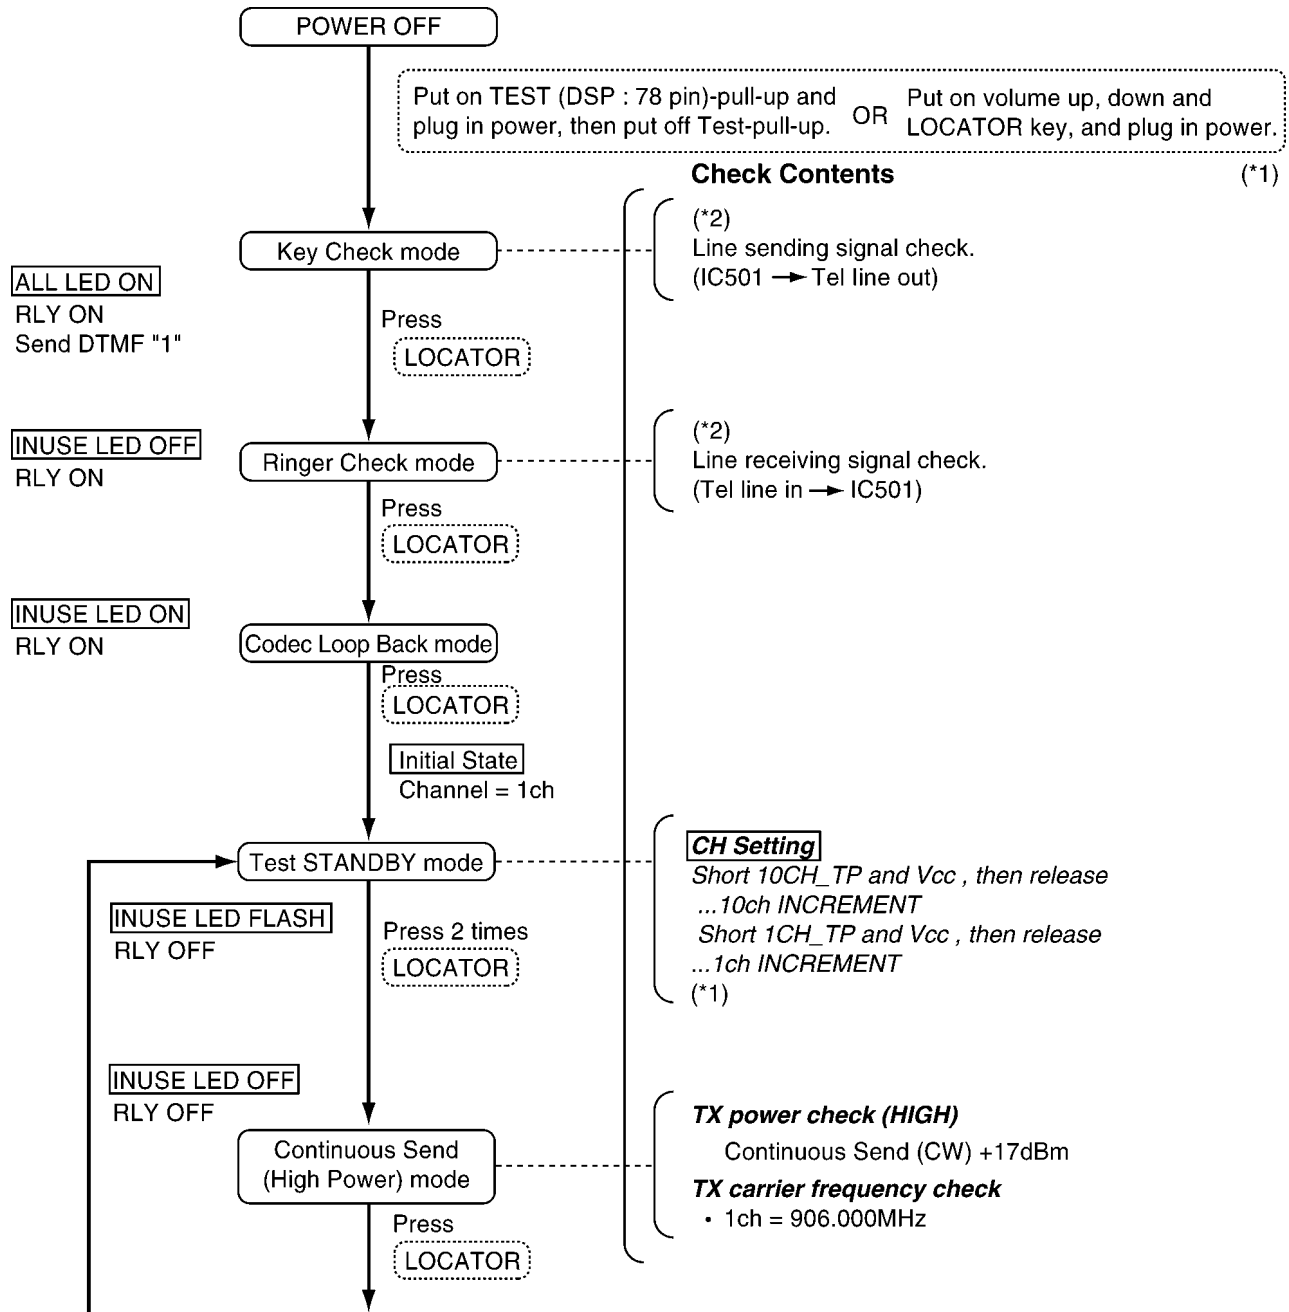

8.12. Check Call ID

BASE UNIT

9 TEST MODE AND ADJUSTMENT

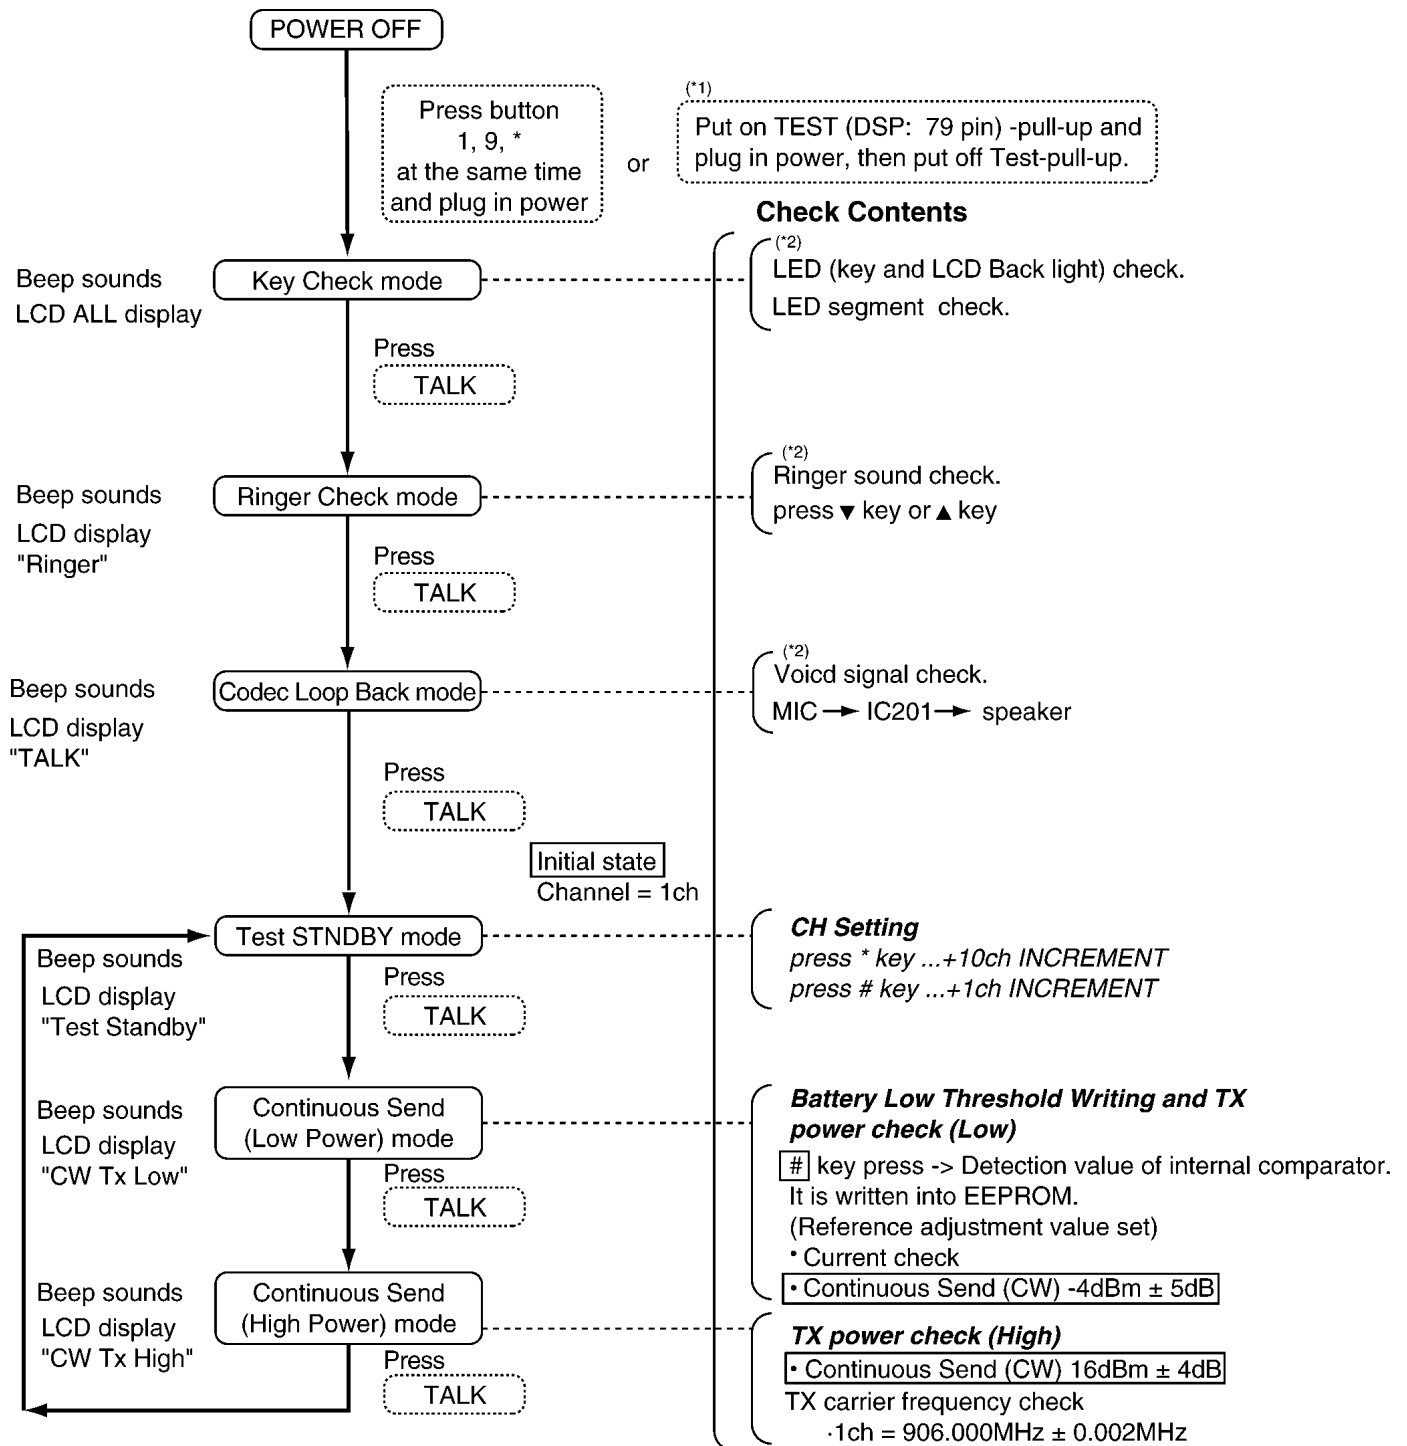

9.1. Test mode flow chart for Base Unit

(*1) See 9.4. Base Unit Reference Drawing

(*2) Special check method for Base Unit individually.

9.2. Test mode flow chart for Handset

(*) See 9.5. Handset Reference Drawing

(*) Special check method for Handset individually.

9.3. Adjustment X101

IN case of SS system, Carrier signal frequency directly by Frequency counter, can not be measured because sending signal is spread by PN code.

So, the confirmation and adjustment is made under the Continuous Send mode of TEST MODE.

Adjust the TX carrier(CW) frequency on the RF unit.

Equipment: Frequency counter

TP for adjustment: TP_ANT

Adjustment point: VC101 (RF unit)

Adjustment range: 906.000 ± 0.002 MHz (1ch)

8	911.250	20	920.250
9	912.000	21	921.000
10	912.750	22	921.750
11	913.500	23	922.500
12	914.250	24	923.250

10 DESCRIPTION

10.1. Frequency

The frequency range of 906.00 MHz ~ 923.25 MHz is used. Transmitting and receiving channel between base unit and handset is same frequency. Refer to the Frequency Table.

10.2. Time Division Duplex (TDD) operation

Transmission/reception between the base unit and handset is performed by time-sharing as shown in Fig. 7. 1 slot time of transmission and reception is 1mS. Same frequency is used in transmitting and receiving. The figure shows an example; the frequency of 3ch is used in transmitting between the base unit and handset.

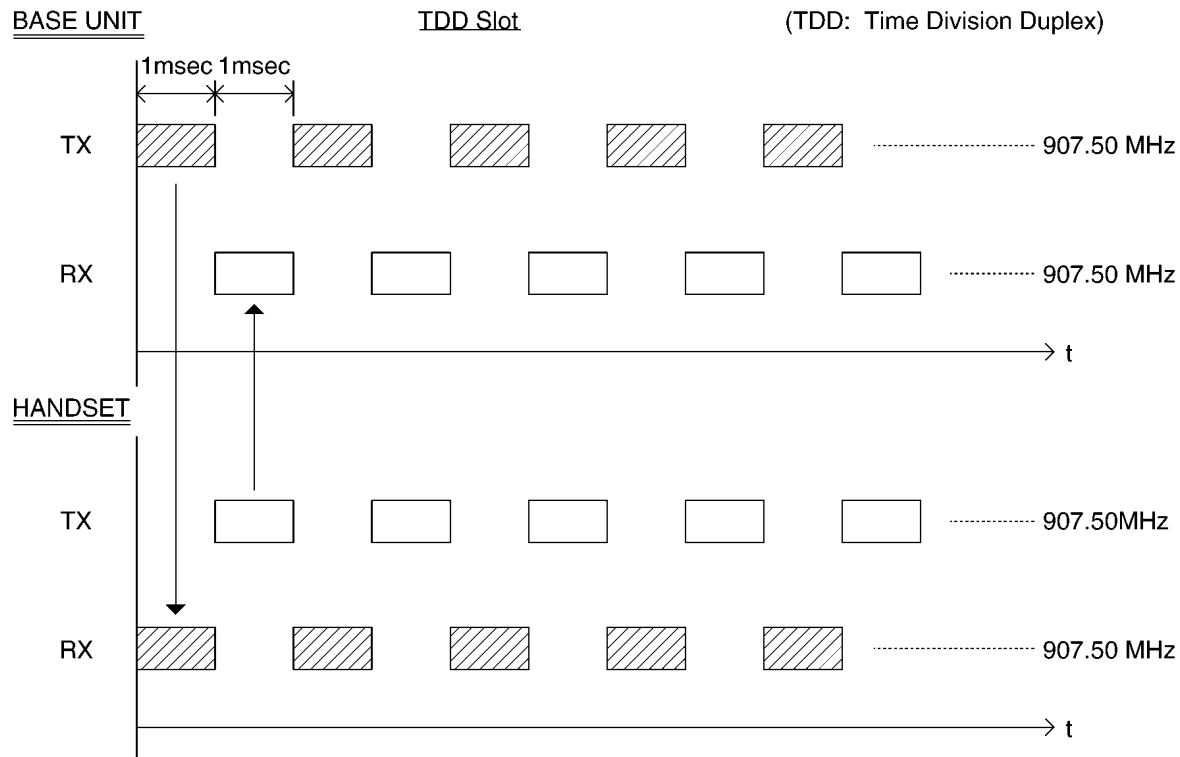

Fig. 7

10.2.1. TDD Frame Format

The TDD frame is 2mS in length, and is composed of two symmetrical 960 μ S TX and RX subframes. Each subframe contains 96 bits of 10 μ S duration, with 40 μ S guard times between both TX and RX subframes.

Each subframe consists of the following four fields:

- A 16-bit Preamble field
- An 8-bit Data Channel field
- An 8-bit Sync Word
- A 64-bit ADPCM Payload

10.3. Spread Spectrum

Transmission and reception are operated using the spread spectrum method.

DSS (Digital Spread Spectrum)

Mixing the original signal with the pseudo random noise code (PN code) works the spread spectrum. In this system PN code is 15 chip. Although the band width is spread fifteen times, the power level per channel becomes lower.

Fig. 8

10.4. Signal Flowchart in the Whole System

Reception

CN101 of the base unit is connected to the TEL line, and the signal is input through the bridge diode D101. While talking the relay (Q121) is turned ON and amplified at the amplifiers Q461, then led to DSP (IC501). DSP generates ADPCM signal. The ADPCM signal is input to RFIC (IC101) of RF UNIT, and is mixed with pseudo random noise code (PN code) to spread the spectrum. RFIC outputs FSK modulated RF signal. The RF signal is passed through the balun (T101) and filter (F102) to be transmitted from the antenna. As for the handset, RF signal from the antenna is input to RFIC passing through filter (F102) and the balun (T101) to perform the de-spread, then input to DSP (IC201). DSP performs ADPCM decoding to convert the signal into the voice signal, then it is output to the speaker.

Transmission

The voice signal input from the microphone is led to DSP (IC201). The DSP generates ADPCM signal. As well as the reception, it is converted into the RF signal by RFIC (IC101). Passing through the balun (T101) and filter (F102), it is transmitted from the antenna. As for the base unit, RF signal from the antenna is input to RFIC (IC101) passing through filter (F102) and the balun (T101) to perform the de-spread, then input to DSP (IC201). DSP performs ADPCM decoding to convert the signal into the voice signal. The voice signal is amplified at the TX amplifier (Q131), then output to the TEL line (CN101) through the relay (Q121) and bridge (D101).

13 NEW CIRCUIT OPERATION (Base Unit)

13.1. SP-PHONE RX Circuit

Circuit Operation:

Telephone Line (T/R) → Q131 → C463 → R448 → C442 → R464 → C441 → pin 38 of IC501 → pins 32 and 33 of IC501 → Speaker

Circuit Diagram

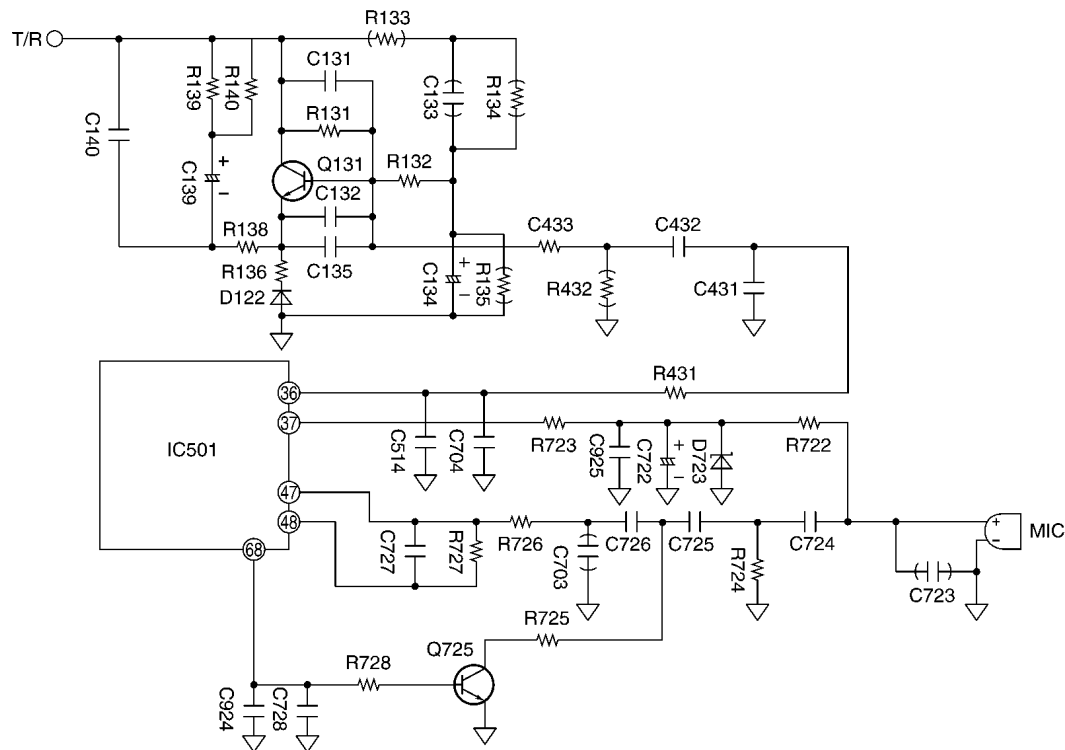

13.2. SP-PHONE TX Circuit

Circuit Operation:

MIC → C724 → C725 → C726 → R726 → pin 47 of IC501 → pin 36 of IC501 → R431 → C432 → C433 → Telephone Line

Circuit Diagram

13.3. Auto Disconnect Circuit

Function:

This circuit is used to detect the fact that another telephone connected to the same line is OFF-HOOK while the unit is in a receiving status or OGM transmitting status.

Circuit Operation:

The voltage pin 40 of IC501 is monitored. If a parallel-connected telephone is put into an OFF HOOK status, the presence/absence of a parallel connection is determined when the voltage changes by 0.2V or more.

When the set detects that a parallel-connected telephone is OFF HOOK status, the line is disconnected.

Circuit Diagram

13.4. Power Supply Circuit

Function:

Power from the AC adaptor passes through a regulating block consisting of IC301.

Circuit Operation:

IC401 is a regulated power supply. The voltage at point A is regulated to 4.5 V by IC301.

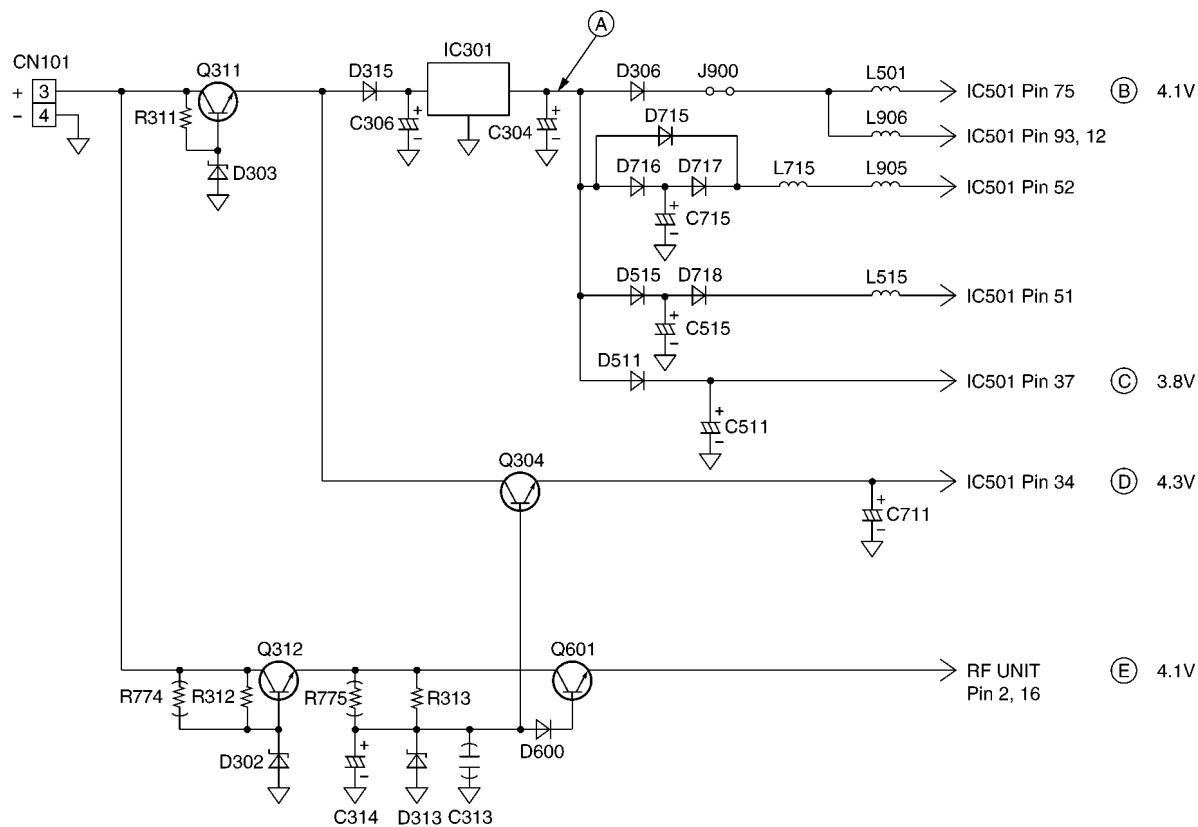

The voltage at point B is dropped by D306 and D307 to 4.1 V.

The voltage at point C is dropped by D511 to 3.8 V.

The voltage at point D is dropped by Q304 to 4.3V

The voltage at point E is dropped by Q312, Q601 to 4.1V

Circuit Diagram

13.5. DTMF Signal

When the DTMF data from the Handset is received, the DTMF signal is output from pin 36 of IC501 and sent to the line through Q131.

13.6. Line Sending Signal

The modulation signal input from the RF unit is demodulated by IC501.

The audio signal output from IC501-36 and is input to telephone line.

Circuit Diagram

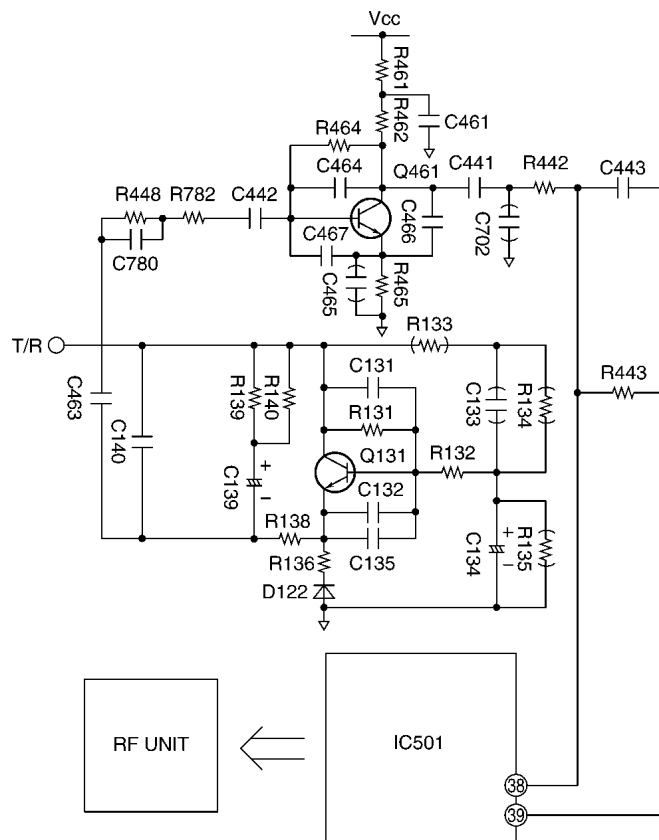

13.7. Line Receiving Signal

The audio signal from line passes through Q106 and IC702, and the signal is input to pin 96 of IC502(BBIC).

IC502 modulates the input audio signal to output to the RF unit.

Circuit Diagram

13.8. Calling Line Identification Circuit (Caller ID)

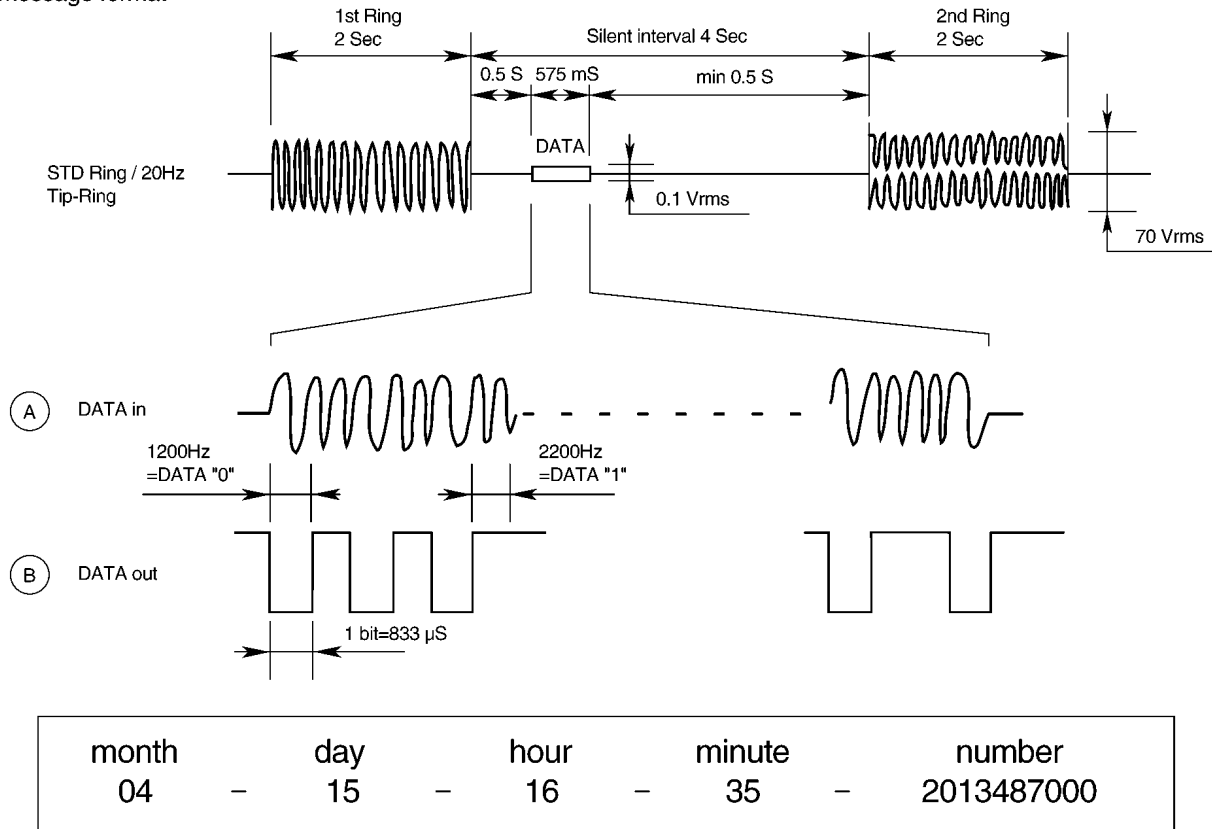

Function:

The caller ID is a chargeable ID which the user of a telephone circuit obtains by entering a contract with the telephone company to utilize a caller ID service. For this reason, the operation of this circuit assumes that a caller ID service contract has been entered for the circuit being used.

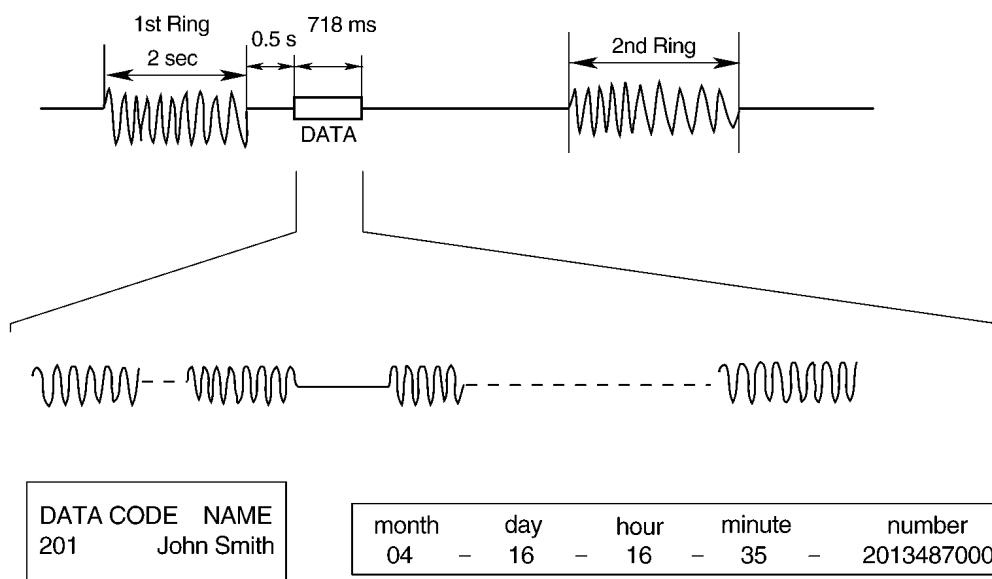

The data for the caller ID from the telephone exchange is sent during the interval between the first and second rings of the bell signal. The data from the telephone exchange is a modem signal which is modulated in an FSK (Frequency Shift Keying) format. Data "0" is a 1200 Hz sine wave, and data 1 a 2200 Hz sine wave.

There are two type of the message format which can be received: i.e. the single message format and plural message format. The plural message format allows to transmit the name and data code information in addition to the time and telephone number data.

- Single message format

- Plural message format

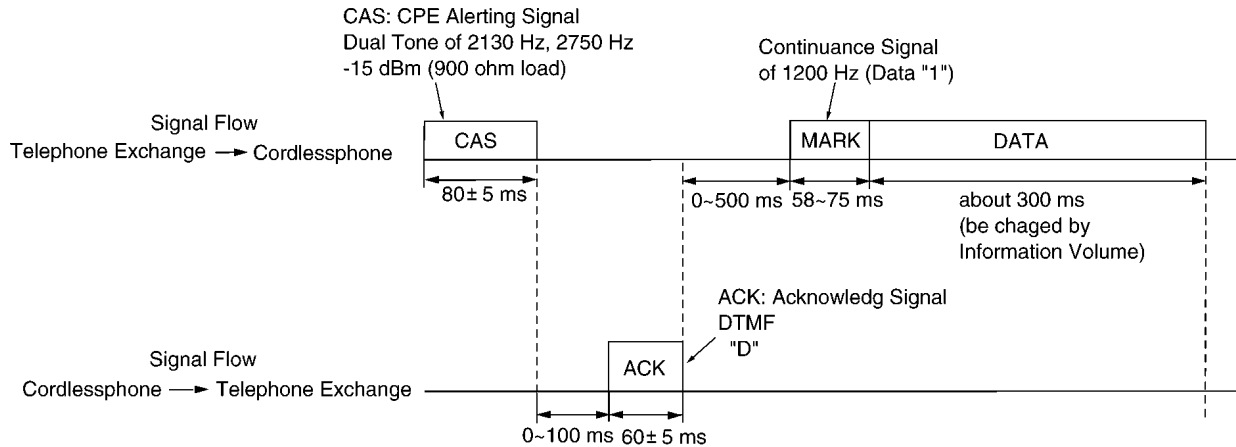

ICall Waiting

Calling Identity Delivery on Call Waiting (CIDCW) is a CLASS service that allows a customer, while off-hook on an existing call, to receive information about a calling party on a waited call. The transmission of the calling information takes place almost immediately after the customer is alerted to the new call so he/she can use this information to decide whether to take the new call.

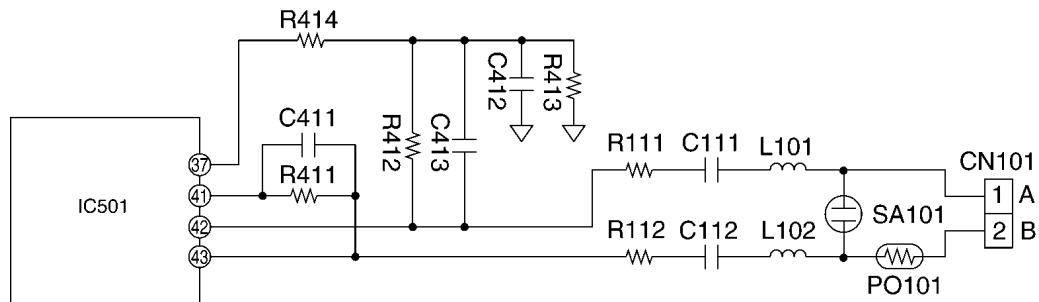

Function:

The CAS signal flows from T/R → R111, R112 collector → C111, C112 → IC501 pins 41~43 and the ACK (DTMF signal) is returned to the telephone exchange. The telephone exchange that received the ACK can send the data in the same manner as the caller ID. If the unit deems that a telephone connected in parallel is in use, ACK is not returned even if CAS is received, and the information for the second and subsequent callers is not displayed on the portable handset display.

Call Waiting Format

Circuit Diagram

13.9. Parallel Connection Detection Circuit

Function:

In order to disable call waiting and stutter tone functions when using telephones connected in parallel, it is necessary to have a circuit that judges whether a telephone connected in parallel is in use or not. This circuit determines whether the telephone connected in parallel is on hook or off hook by detecting changes in the T/R voltage.

Circuit Operation:

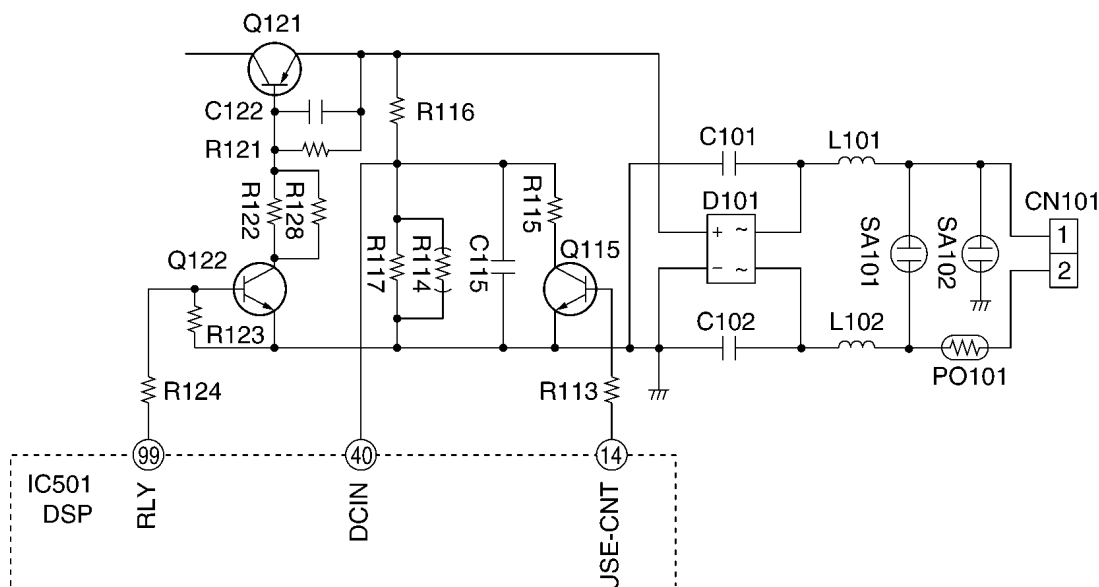

Parallel connection detection when on hook:

When on hook Q115 is ON, the voltage is monitored pin 40 of IC501. There is no parallel connection if the voltage is 1.65 V or higher, while a parallel connection is deemed to exist if the voltage is lower.

Parallel connection detection when off hook:

When off hook Q115 is OFF, the voltage is monitored pin 40 of IC501; the presence/absence of a parallel connection is determined when the voltage changes by 0.2 V or more.

Circuit Diagram

13.10. DSP (Digital Speech/Signal Processing) Circuit

General Description:

(IC501, IC751) is a digital speakerphone/speech/signal processing system that implements all the functions of speech compression, record and playback, and memory management required in a digital telephone answering machine.

The DSP system is fully controlled by a host processor IC501. The host processor provides activation and control of all that functions, such as speech Recording, Playback, Tone detecting and Line monitoring.

The DSP system comprises of following.

- a Host Processor.
- a Digital Signal Processor which includes the firmware implemented functions.
- a FLASH MEMORY (IC751), which is used for stored voice messages and synthesized voice.

Circuit Diagram

- **Voice Message Recording**

The DSP system use a proprietary speech compression technique to record and store voice message in FLASH MEMORY (IC751).

An error correction algorithm is used to enable playback of these messages from the FLASH MEMORY (IC751).

- **DTMF Detection**

The DTMF detection is implemented by the DSP system in software. The DTMF detection is performed during Record, Playback, and Line Monitoring modes of operation.

- **Synthesized Voice**

The DSP implements synthesized Voice, utilizing the built in speech detector and an FLASH MEMORY (IC751), which stored the vocabulary.

- **Caller ID and Call Waiting CID demodulation**

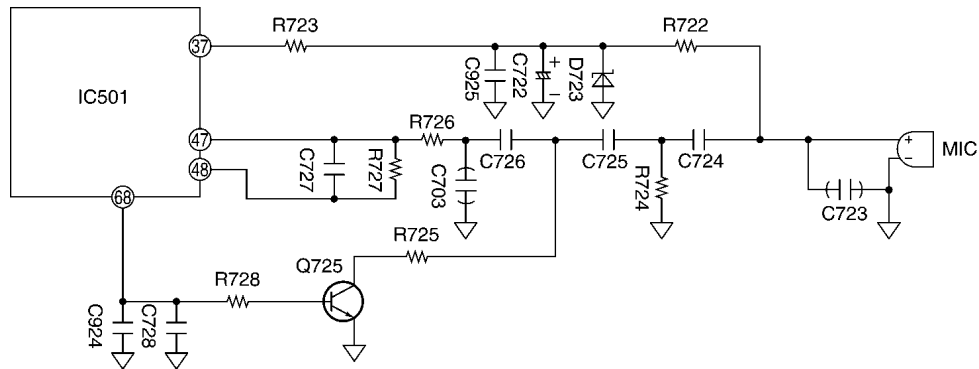

The DSP implements monitor and demodulate the FSK signals that provide CID information from the Central Office.

13.11. Greeting Recording Circuit

Circuit Operation:

MIC → C724 → C725 → C726 → R726 → pin 47 of IC501.

Circuit Diagram

13.12. Greeting Play Back Circuit

Circuit Operation:

pin36 of IC501 → R431 → C432 → C433 → Telephone Line.

Circuit Diagram

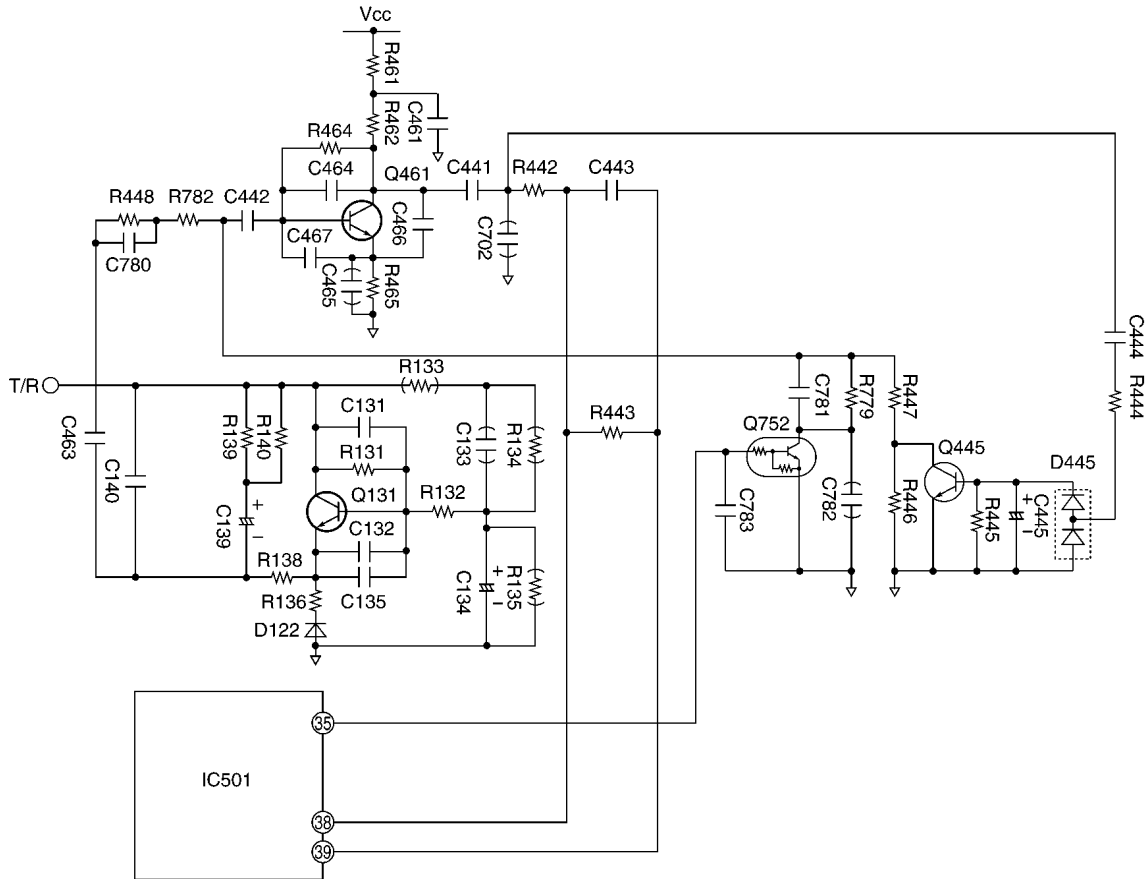

13.13. ICM Recording Circuit

Circuit Operation:

Telephone Line → Q131 → C463 → R448 → R782 → C442 → R464 → C442 → R464 → C441 → pin 32 and 33 of IC501.

Circuit Diagram

13.14. ICM Play Circuit

Circuit Operation:

pins 32 and 33 of IC501 → Speaker.

Circuit Diagram

13.15. Telephone Line Interface

Circuit Operation:

I ANSWER

In the idle mode, Q121 is open to cut the DC loop current and decrease the ring load. When ring voltage appears at the Tip (T) and Ring (R) leads (When the telephone rings), the AC ring voltage is transferred as follows:

T → L101 → R103 → C103 → Q101 → IC501 pin 64.

When the CPU (DSP) detects a ring signal, Q121 turns on, thus providing an off-hook condition (active DC current flow through the circuit) and the following signal flow is for the voice signal.

T → D101 → Q121 → Q131 → R138 → C140 → D101 → L102 → PO101 → R

I ON HOOK

Q121 is open, Q121 is connected as to cut the DC loop current and to cut the voice signal. The unit is consequently in an on-hook condition.

I SPECIFICATIONS

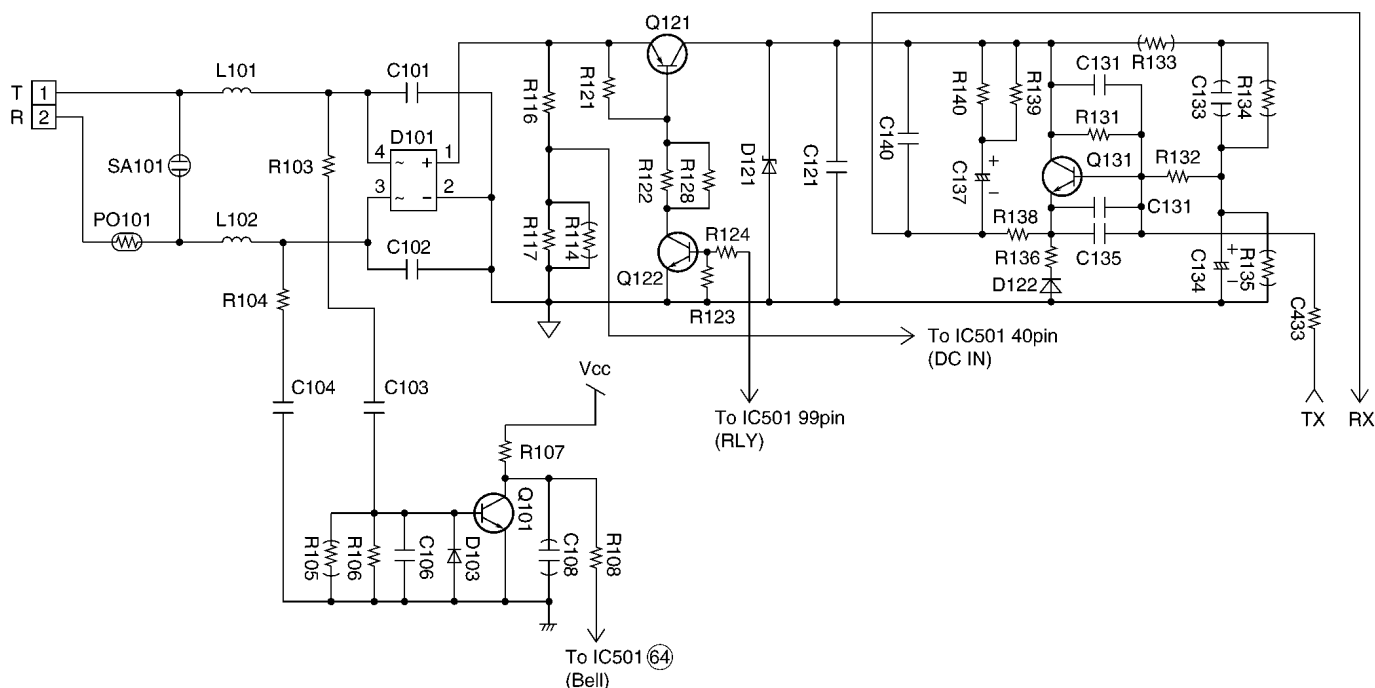

In the on-hook state (idle), the current flows between the telephone line and the unit is as follows:

T → L101 → R103 → C103 → R106 → C104 → R104 → L102 → PO101 → R.

The DC component is blocked by C103, C104: thereby providing an on-hook condition.

The AC interface impedance is over 47 kΩ; thus, satisfying the telephone company requirements.

Circuit Diagram

13.16. Intercom Mode

- When the base unit LOCATOR/INTERCOM button is pressed, a call monitor signal (intercom sound) is output from pins 32 and 33 of IC501. Thus a monitor tone is heard from the speaker.
- At the same time, flashing of the IN USE/CHARGE (LED541) is obtained from pin 65 of IC501. This status is called "Intercom stand-by".
- The receiving signal flows:
RF → pin 32 and 33 of IC501 → SP
- The transmission signal flows:
MIC → C724 → C725 → C726 → R726 → pin 47 of IC501 → RF

13.17. Initializing Circuit

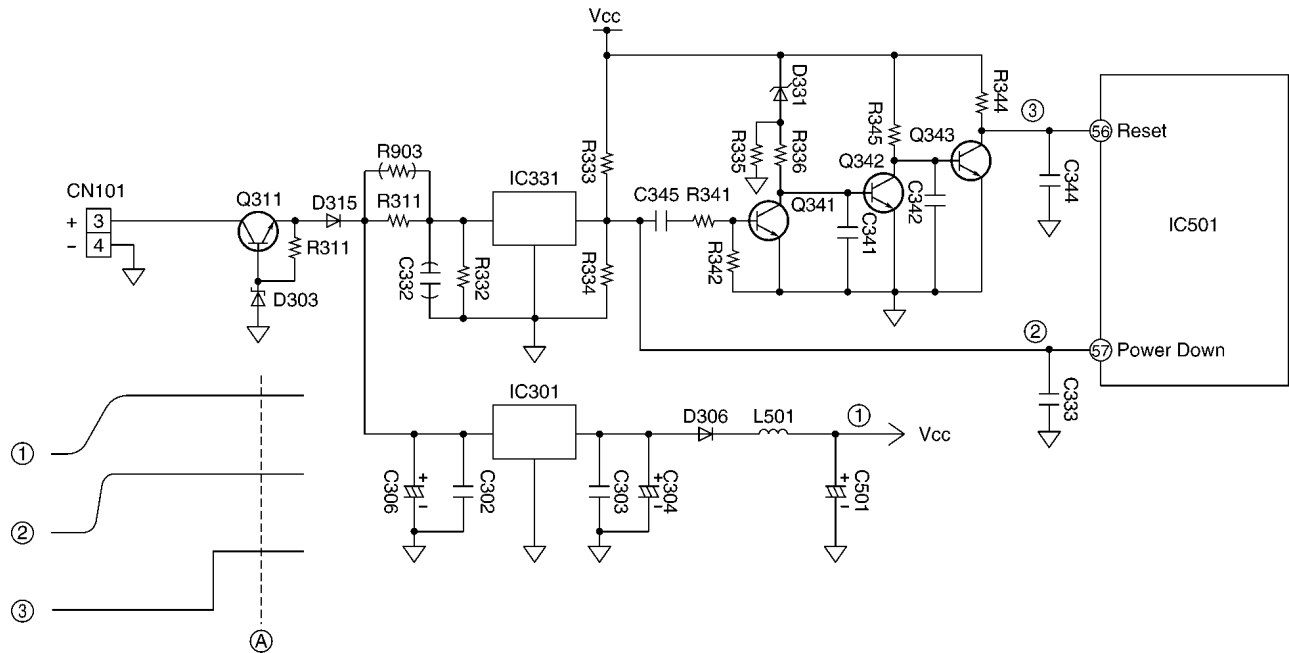

Function:

This circuit is used for to initialize the microcomputer when it incorporates an AC adaptor.

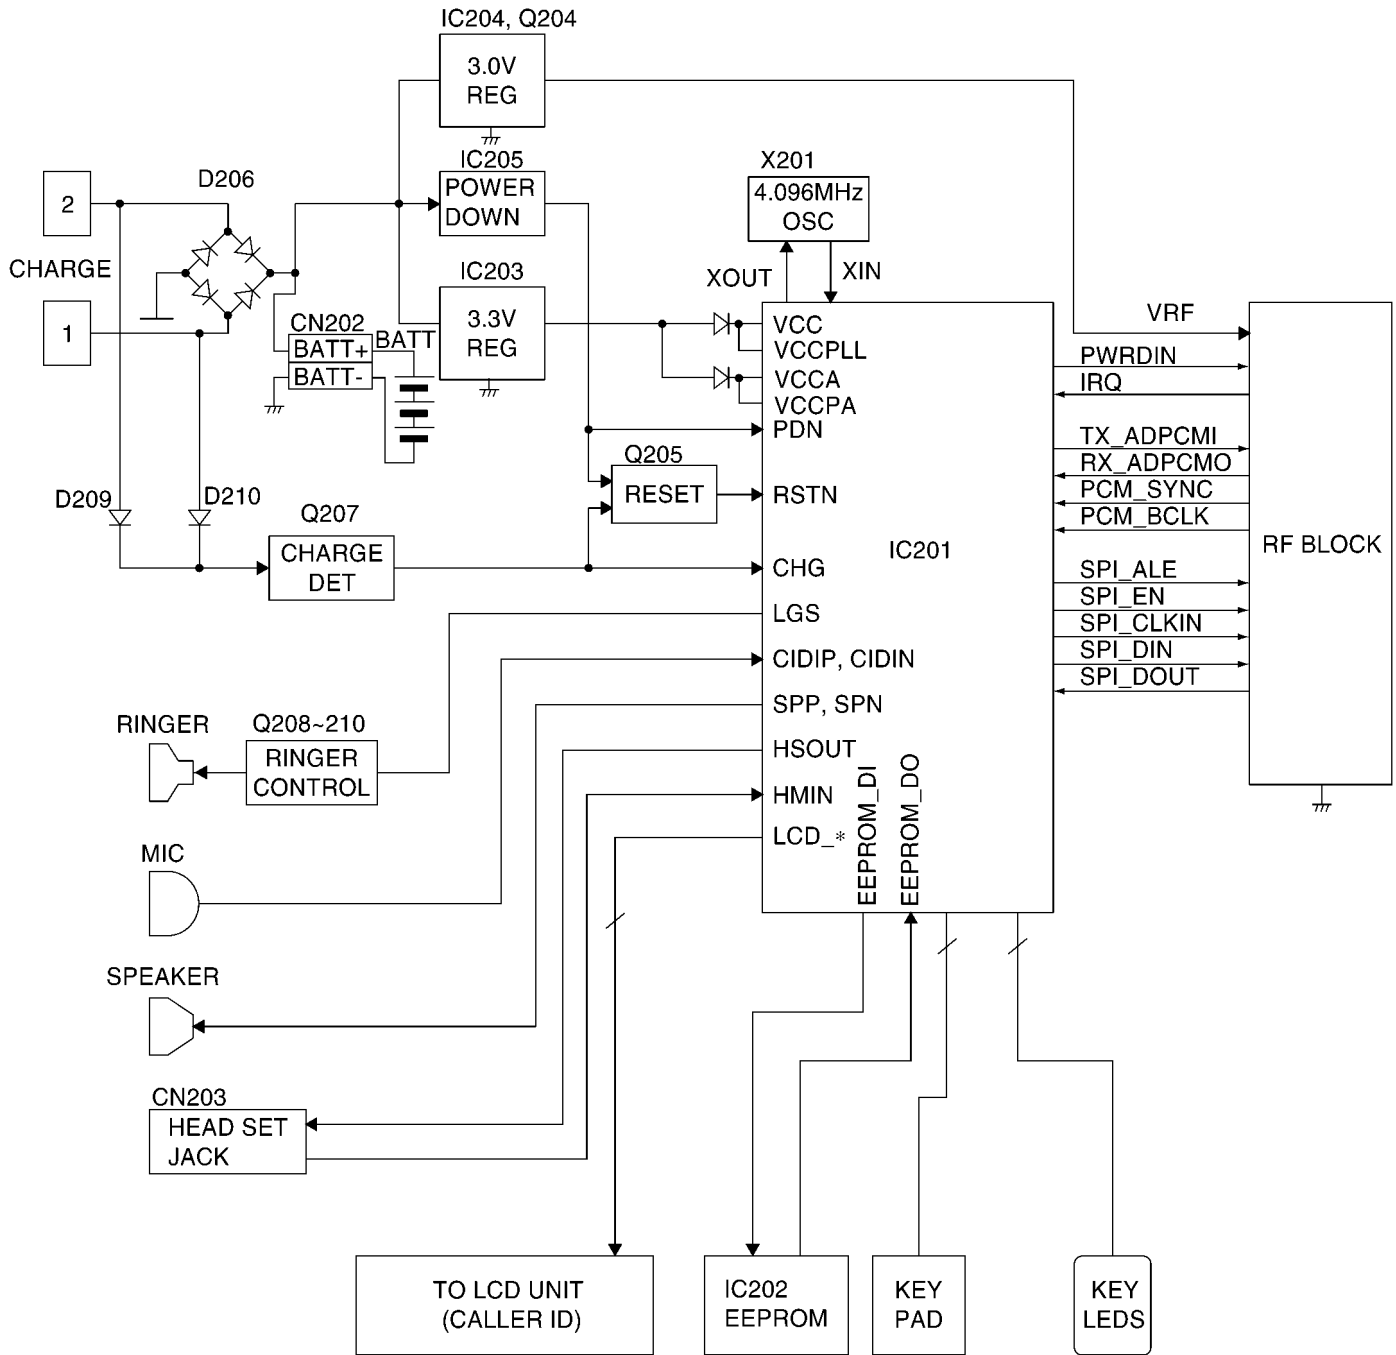

Circuit Operation:

When the AC Adaptor is inserted into the unit, then the voltage is shifted by IC301, D306 and power is supplied to the DSP. The set can operate beyond point A in the circuit voltage diagram.

Circuit Diagram

14 BLOCK DIAGRAM (Handset)

15 NEW CIRCUIT OPERATION (Handset)

15.1. Power Supply Circuit

Voltage is supplied separately to each block.

Block Diagram (Handset Power)

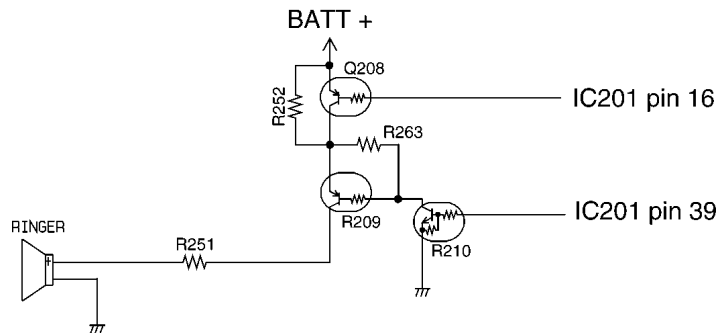

15.2. Charge Circuit

Ni-Cd battery is connected to CN202. When the handset is put on the cradle of the base unit, the power is supplied from CHARGE1 and CHARGE2 terminals to charge the battery. Q207 detects the voltage of CHARGE1 and CHARGE2 terminals, then the handset makes ID code setting (*) with the base unit.

15.3. Ringer Circuit

If the ringer volume is set to low and an alarm tone is output from 39 pin, IC201 DSP and input to Q209. Then Q208 is turned off. If the ringer volume is set to high, Q208 turns on and results in a louder beep tone.

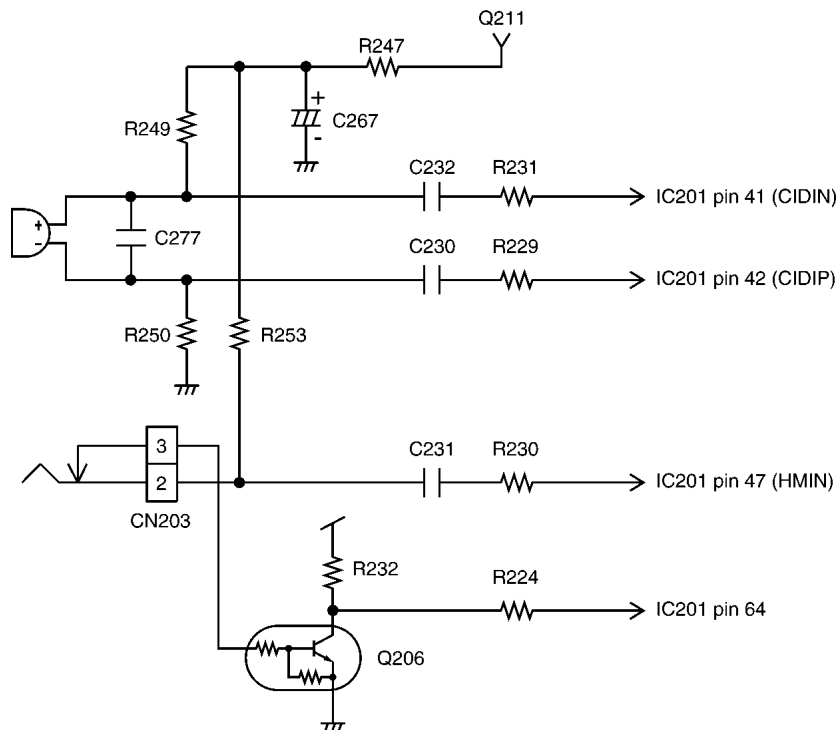

Circuit Diagram

15.4. Sending Signal

The voice signal from the microphone input to pin 42 (CIDIP) and pin 41 (CIDIN) of IC201 (DSP). CN203 is the headphone jack. When the headphone is connected, the Q206 detect it. The input from the microphone of the handset (CIDIN, CIDIP) is cut and the microphone signal from the headphone is input to pin 47 of IC201 (HMIN). Also the power for the microphone is supplied from Q211, and the power is turned OFF on standby.

Circuit Diagram

15.5. Reception Signal Circuit

The received signal from the base unit is output from pins 33 (SPN) and 32 (SPP) of IC201 (DSP) as the voice signal. SPN is the inverse output of SPP, and the speaker is driven by SPN and SPP. CN203 is the headphone jack. When the headphone is connected to this jack, the output to the speaker of the handset (SPN,SPP) is cut and the voice signal is output to the headphone (HSOUT) only.

19 HOW TO REPLACE FLAT PACKAGE IC

19.1. Preparation

- SOLDER

Sparkle Solder 115A-1, 115B-1 or Almit Solder KR-19, KR-19RMA

- Soldering iron

Recommended power consumption will be between 30 W to 40 W.

Temperature of Copper Rod 662 \pm 50°F (350 \pm 10°C)

(An expert may handle between 60 W to 80 W iron, but beginner might damage foil by overheating.)

- Flux

HI115 Specific gravity 0.863

(Original flux will be replaced daily.)

19.2. Procedure

1. Temporary fix FLAT PACKAGE IC by soldering on two marked 2 pins.

● - - - - - Temporary soldering point.

*Most important matter is accurate setting of IC to the corresponding soldering foil.

2. Apply flux for all pins of FLAT PACKAGE IC.

○ - - - - - Flux

3. Solder employing specified solder to direction of arrow, as sliding the soldering iron.

19.3. Modification Procedure of Bridge

1. Re-solder slightly on bridged portion.
2. Remove remained solder along pins employing soldering iron as shown in below figure.

23 REPLACEMENT PARTS LIST

This replacement parts list are U.S.A. version only.

Note:

1. RTL (Retention Time Limited)

The marking (RTL) indicates that the Retention Time is limited for this item.

After the discontinuation of this assembly in production, the item will continue to be available for a specific period of time. The retention period of availability is dependent on the type of assembly, and in accordance with the laws governing part and product retention.

After the end of this period, the assembly will no longer be available.

2. Important safety notice

Components identified by a Δ mark special characteristics important for safety. When replacing any of these components, use only manufacture's specified parts.

3. The S mark indicates service standard parts and may differ from production parts.

4. RESISTORS & CAPACITORS

Unless otherwise specified;

All resistors are in ohms (Ω) K=1000 Ω , M=1000k Ω

All capacitors are in MICRO FARADS (μ F) P= μ F

*Type & Wattage of Resistor

Type

ERC:Solid	ERX:Metal Film	PQ4R:Carbon

24 FOR SCHEMATIC DIAGRAM

24.1. Base Unit (28 SCHEMATIC DIAGRAM (Base Unit))

Notes:

1. DC voltage measurements are taken with voltmeter from the negative voltage line.

Important Safety Notice:
Components identified by ⚠ mark have special characteristics important for safety. When replacing any of these components, use only the manufacturer's specified parts.

This schematic diagram may be modified at any time with the development of new technology.

24.2. Handset (30 SCHEMATIC DIAGRAM (Handset))

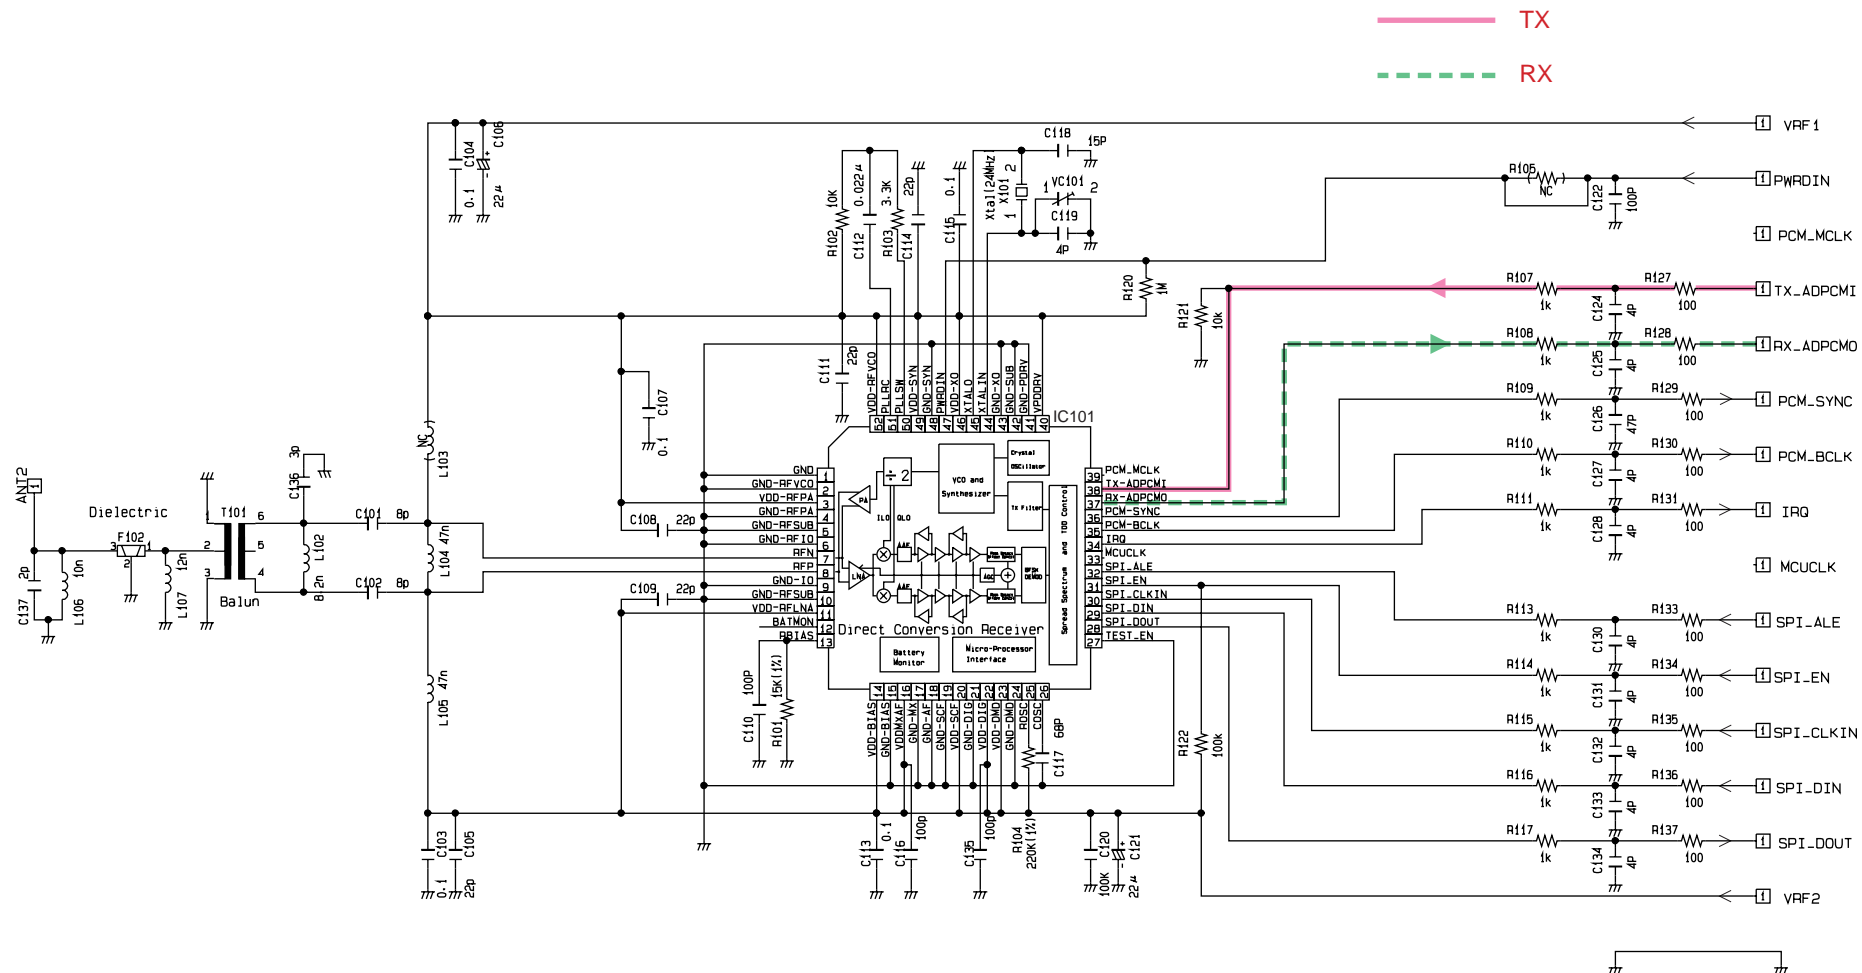

Notes:

1. DC voltage measurements are taken with an oscilloscope or a tester with a ground.
2. The schematic diagrams and circuit board may be modified at any time with the development of new technology.

1.1. REPLACEMENT PARTS LIST

Reason for Change		The following reasons (1-8) are indicated in the Notes below.	
1. Improve performance			
2. Change of material or dimension			
3. To meet approved specification			
4. Standardization			
5. Addition			
6. Deletion			
7. Correction			
8. Other			
Interchangeability Code		The following interchangeabilities (V-Z) are indicated in the Notes below.	
Parts	Set Production	Description	
V Original New	Early (before change) Late (after change)	Original or new parts may be used in early or late production sets. Use original parts until exhausted, then stock new parts.	
W Original New	Early (before change) Late (after change)	Original parts may be used in early production sets only. New parts may be used in early or late production sets. Use original parts where possible, then stock new parts.	
X Original New	Early (before change) Late (after change)	New parts only may be used in early or late production sets. Stock new parts.	
Y Original New	Early (before change) Late (after change)	Original parts may be used in early production sets only. New parts may be used in late production sets only. Stock both original and new parts.	
Z	Other
